APPENDICES

APPENDIX A
Species At Risk Screening

1.0 INTRODUCTION

WSP Canada Inc. (WSP; formerly Golder Associates Ltd.) has been retained by GM BluePlan Engineering Limited (GMBP) on behalf of the Region of Peel (the Region) to conduct natural environment studies for a Schedule 'C' Municipal Class Environmental Assessment (EA) for the Port Credit East Water and Wastewater Servicing Optimization (the Project) in the City of Mississauga, Region of Peel, Ontario. The purpose of the Project is to evaluate alternative strategies for the existing Elmwood, Hiawatha, and Rosemere sewage pumping station (SPS) and Lakeshore Road servicing areas and to develop an integrated servicing strategy that supports existing servicing needs and projected growth.

To support selection of a preferred solution for the Project, WSP was tasked with an initial desktop assessment followed by field investigations where alternatives overlapped / approached sensitive natural features (Golder 2020). Further field investigation in 2022 provided updated in-depth understanding of the existing conditions.

The purpose of this Natural Environment Report is to build upon WSP's previously completed desktop assessment and field investigations to evaluate the potential Project impacts to the natural environment, and recommended mitigations associated with the refined Project design, and to recommend work for future Project phases.

With the completion of Phase 2, a preferred solution has now been identified which includes a new deep trunk sewer and sub-transmission watermain along Lakeshore Road, a new Rosemere SPS at the existing location with twinned forcemains extending to the east to Sandham Road, the decommissioning of the Elmwood and Hiawatha SPS, proceeding with gravity sewers to connect to the proposed deep trunk sewer on Lakeshore Road. These areas are generally defined as the "sites" for the Project and are shown on Figure 1. The sites include the initial areas considered in Phase 1 of the Project as well as additional above-ground infrastructure identified during Phase 2. Based on the policies of the Provincial Policy Statement (PPS), adjacent lands within 120 m of the sites (the study areas) were also assessed as part of this Natural Environment Report. Below-ground infrastructure was not considered in the delineation of Project spatial boundaries for the purpose of the natural environment assessment unless there was potential for above-ground disturbance (e.g., open trench installation of pipelines).

2.0 POLICY CONTEXT

Sensitive natural features considered for this Project include designated features (e.g., Provincially Significant Wetlands [PSW]), species at risk (SAR), Credit Valley Conservation (CVC) regulated areas, fish habitat, and significant wildlife habitat (SWH) as identified in the following Acts and policy documents:

- Provincial Policy Statement (PPS; MMAH 2020a)
- *Endangered Species Act, 2007* (ESA; Ontario 2007)
- *Species at Risk Act* (SARA; Canada 2002)
- *Migratory Birds Convention Act, 1994* (MBCA; Canada 1994) and Migratory Birds Regulations, 2022 (MBR, 2022; Canada 2022)
- *Fisheries Act* (Canada 1985)
- Region of Peel Official Plan (Region of Peel 2022)

- Mississauga Plan and Mississauga Official Plan (City of Mississauga 2023)
- Parkway Belt West Plan (Ontario 1978)
- Greenbelt Plan (Ontario 2017)
- Growth Plan for the Greater Golden Horseshoe (MMAH 2020b)
- O. Reg. 160/06 Credit Valley Conservation: Regulation of Development, Interference with Wetlands and Alterations to Shorelines and Watercourses

3.0 DESCRIPTION OF THE PROPOSED WORKS

It was determined through completion of Phase 2 that trenchless tunnelling construction methodology was integral to the selection of the preferred solution. Most of the Project infrastructure will be located below ground and installed using trenchless methods and within the municipal rights-of-way (ROW). However, some above-ground disturbance is required at construction compound locations, including easements and work compounds required for laydown areas and equipment maneuvering.

The preliminary preferred design concept includes the following components:

1) New Deep Trunk Sewer on Lakeshore Road;
2) New Sub-Transmission Watermain on Lakeshore Road;
3) New Rosemere SPS and construction of associated twinned forcemains; and
4) Decommissioning of Elmwood and Hiawatha SPS and construction of new gravity sewers.

Lakeshore Road Deep Trunk Sewer and Sub-transmission Watermain

- This section involves the construction of a new deep trunk sewer and sub-transmission watermain along Lakeshore Road, including two separate shafts and two separate tunnels along Lakeshore Road, using a tunnel boring machine (TBM).
- The Marina Park municipal parking lot at Lakeshore Road West and Front Street North will be used for staging on the western extent, and the municipal parking lot in the northeast corner of Lakeshore Road East and Elmwood Avenue North will be used for staging on the eastern extent.
- Both construction compound locations will be completed on City-owned properties to minimize disturbance to residents and businesses along Lakeshore Road.

Rosemere SPS

- The new Rosemere SPS at the existing location will have twinned forcemains extending to the east to Sandham Road. The new SPS will replace existing aging infrastructure and be built in accordance with new Regional SPS Standards.

- The area south of Rosemere Road adjacent to Stavebank Road will be used for construction staging on the western extent. A construction compound located at Sandham Road and Vest Drive is required to support constructability of tunnelled twinned forcemains to the eastern extent.
- Twinned forcemains will be tunnelled through City-owned property south of Rosemere Road and connect to existing wastewater infrastructure within the ROW to the east on Sandham Road.

Elmwood SPS / Hiawatha SPS

- The existing Elmwood and Hiawatha SPS will be decommissioned, and a series of proposed tunnelled gravity sewers will connect new sewers from the Hiawatha SPS location to the new sewers from Elmwood SPS, and ultimately to the new Lakeshore Road deep trunk sewer.
- Tree impacts will be mitigated through tunnelling a minimum depth of 1.2 m under Tree Preservation Zones (TPZ). Tunnelling will avoid going directly beneath tree trunks. The last connection to Lakeshore Road will incorporate an incoming diversion gravity sewer from Elmwood Avenue South to a construction compound within the ROW at Elmwood Avenue North adjacent to the municipal parking lot.
- A total of six (6) construction compound locations are required to support constructability of the new tunnelled gravity sewers as a result of decommissioning Elmwood and Hiawatha SPS.

4.0 METHODS

4.1 Background Review and Desktop Species at Risk Screening

As part of the desktop assessment in 2020, a background information search and literature review were completed to gather data and provide context for the evaluation of natural features within the study areas identified for the long-list of alternatives, that being an area generally limited by Front Street in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Seneca Avenue to the north, and Lake Ontario to the east in the City of Mississauga . Also completed was a desktop Species at Risk (SAR) Screening for species listed under the ESA and SARA. Species with ranges overlapping the study areas, or with recent occurrence records in the vicinity, were screened by comparing their habitat requirements to habitat conditions in the study areas. The potential for the species to occur in the study areas was determined based on habitat availability and occurrence records. Refer to the desktop assessment report (Golder 2020) for further details.

All background review and desktop SAR screening information was updated for this report to include any applicable policy changes, updated natural heritage information, as well as the preliminary design of the chosen preferred solution.

4.2 Field Reconnaissance

A field reconnaissance was completed by a WSP biologist on October 5, 2021 to confirm existing conditions at the Rosemere, Hiawatha, and Elmwood SPS sites (Figure 1). The biologist walked through each site where access was available, documenting general conditions and confirming presence of sensitive natural features identified through the desktop assessment (Golder 2020). Where access was unavailable, the biologist scanned the area from a vantage point, using binoculars if necessary. Searches were also conducted to document the presence or absence of suitable habitat for those species identified in the desktop SAR screening completed as part of the initial desktop assessment (Golder 2020).

A second field reconnaissance was completed on October 7, 2022 by WSP biologists to confirm existing conditions documented in 2021, and to survey two additional shaft locations (east and west shaft along Lakeshore Road between Front Street and Elmwood Avenue) not previously visited. A fish habitat assessment was also conducted along Mary Fix Creek and Kenollie Creek in the Rosemere study area.

Methods were similar to those described above, with biologists confirming/documenting general conditions, sensitive natural features, and suitable habitat for SAR. Additionally, for the fish habitat assessment, the length of Mary Fix Creek and Kenollie Creek within the Rosemere study area were surveyed and the following data were collected:

- Watercourse characteristics
- Bank and riparian characteristics
- In-situ water quality parameters
- Presence of potential barriers and / or impediments to fish movement
- Presence and potential of spawning, rearing, and overwintering habitat for the fish that could inhabit the waterbody
- Instream habitat within the section surveyed into distinct habitat units, which correspond to areas of similar habitat type (typically morphology). Within each habitat unit, the following data was collected
    - bank-full and wetted width
    - habitat unit length
    - maximum depth
    - substrate composition (visually estimated as a percentage of total area within each habitat unit)
    - availability of instream cover (visually estimated as a percentage of total area within each habitat unit)
    - bank stability

The field reconnaissance also served to inform the need for further (targeted) survey work for the detailed design phase of the project.

4.3 Assessment of Significance and Impact Assessment

An assessment was conducted to determine if any significant environmental features or SAR exist, or have moderate or high potential to exist, in the study areas and assess whether the Project would negatively impact surrounding significant natural heritage features or SAR.

5.0 EXISTING CONDITIONS

5.1 Elmwood

The Elmwood site is bounded to the northeast by Elmwood Avenue South, to the northwest by St. Lawrence Drive and to the southeast and southwest by Lake Ontario (Figure 2). The shoreline is stabilized with large boulders. A paved public trail known as Waterfront Trail runs through the centre of the site.

The Elmwood site is mainly characterized by Constructed Parkland (CGL_2; i.e., Tall Oaks Park) with manicured lawn and sparsely planted immature to mature deciduous trees. Representative photos are provided (Photos 1-4). The trees consist of species that are native to Ontario, such as Kentucky coffee-tree (*Gymnocladus dioicus*), silver maple (*Acer saccharinum*), swamp white oak (*Quercus bicolor*), sugar maple (*Acer saccharum*), northern red oak (*Quercus rubra*), and tuliptree (*Liriodendron tulipifera*) as well as non-native species, such as ginkgo (*Ginkgo biloba*), Norway maple (*Acer platanoides*), and London plane (*Platanus* × *acerifolia*). There is a narrow fringe of cultural meadow/thicket (CUM1/CUT) along the shoreline containing a variety of wildflowers and shrubs.

Landcover in the northern portion of the site, to the east of Waterfront Trail, consists of manicured lawn with mature northern red oak trees (Photos 5-8). To the west of Waterfront Trail, there is a brick building associated with the Elmwood SPS. Beyond this building, there is a small Cultural Woodland (CUW1) highly disturbed by anthropogenic use and dumped garbage (Photos 9-12). Trees in this Cultural Woodland area are predominantly immature ash (*Fraxinus* sp.), with sparse representation of mature northern red oak trees with cavities and large cracks in the bark.

Off-site, the northeastern and northwestern portions of the study area are characterized by residential neighbourhoods. The southwestern portion of the study area is characterized by additional areas of Constructed Parkland (CGL_2), and Lake Ontario occurs in the southeastern portion of the study area. Two dead American eel (*Anguilla rostrata*) individuals were observed washed up on the shoreline during the site reconnaissance in October 2022 (Photos 13-14).

The suite of wildlife species found at this location was expected and typical of urban environments, parkland, lakeshore habitat, and isolated natural areas, and included species such as black-throated blue warbler (*Setophaga caerulescens*), mallard (*Anas platyrhynchos*), ring-billed gull (*Larus delawarensis*), and golden-crowned kinglet (*Regulus satrapa*). Given the timing of the site reconnaissance (i.e., in October, outside of the core breeding period for wildlife) all birds were observed during migration and therefore observations are not an indication of suitable breeding habitat.

Photo 13: Dead American eel (*Anguilla rostrata*) observed washed up on the shoreline at the Elmwood site.

Photo 14: Dead American eel (*Anguilla rostrata*) observed washed up on the shoreline at the Elmwood site.

5.2 Hiawatha

The Hiawatha site is bounded to the northwest by Cumberland Drive, to the northeast and southwest by residential properties, and to the southeast by Lake Ontario (Figure 3). A paved trail runs through the centre of the site. The shoreline is stabilized with large boulders.

The Hiawatha site is characterized by Constructed Parkland (CGL_2; i.e., Hiawatha Park) with manicured lawn and planted deciduous and coniferous trees. There is a children's playground in the centre of the site. Representative photos are provided (Photos 15-18). The trees on the site consist of species that are native to Ontario, such as sugar maple, silver maple, swamp white oak, northern red oak, white spruce (*Picea glauca*), and eastern hemlock (*Tsuga canadensis*), as well as non-native species, such as Norway maple, littleleaf linden (*Tilia cordata*), lilac (*Syringa vulgaris*), and weeping willow (*Salix babylonica*). There is a narrow fringe of Cultural Meadow/Thicket along the northeastern edge of the site containing a variety of native and non-native wildflowers and shrubs.

Off-site, the northeastern, northwestern, and southwestern portions of the study area are characterized by residential neighbourhoods. Lake Ontario occurs in the southeastern portion of the study area.

The suite of wildlife species found at this location was expected and typical of urban environments, parkland, lakeshore habitat, and isolated natural areas, and included species such as mute swan (*Cygnus olor*), herring gull (*Larus argentatus*), golden-crowned kinglet, Canada goose (*Branta canadensis*), and white-breasted nuthatch (*Sitta carolinensis*). Given the timing of the site reconnaissance (i.e., in October, outside of the core breeding period for wildlife) all birds were observed during migration and therefore observations are not an indication of suitable breeding habitat. An individual monarch (*Danaus plexippus*; special concern under the ESA) was observed in this area, and suitable host plants (common milkweed, *Asclepias syriaca*) and foraging habitat (flowering plants) is present throughout much of the study area.

Photo 15: Centre of the Hiawatha site facing northwest.

Photo 16: Centre of the Hiawatha site facing northeast.

Photo 17: Centre of the Hiawatha site facing southeast.

Photo 18: Centre of the Hiawatha site facing southwest.

5.3 Rosemere

The Rosemere site extends from the intersection of Rosemere Road and Stavebank Road to approximately Vesta Drive to the northeast (Figure 4). A brick building associated with the Rosemere SPS is located in the northwest portion of the site.

The Rosemere site is characterized by two creeks, Kenollie and Mary Fix Creek, and the surrounding naturalized but sparse deciduous trees forming a Cultural Woodland (CUW1). Both creeks are straightened concrete channels with a steep, riparian area. Canopy trees present are predominantly non-native species, such as Norway maple, black locust (*Robinia pseudoacacia*), weeping willow and Manitoba maple (*Acer negundo*), as well as native species such as green ash (*Fraxinus pennsylvanica*), black walnut, sugar maple, sassafras (*Sassafras albidum*) and basswood (*Tilia americana*). There is a deciduous forest in the northern portion of the study area that appears to have an abundance of dead ash trees. Landcover in the western and southern portions of the study area is characterized by residential areas.

Mary Fix Creek flows along the southeastern border of the site until its confluence with Kenollie Creek near the end of Rosemere Road (Figure 4). The creek has a straightened channel, and the bed and banks have been lined with concrete along the entire assessed reach. Habitat units within the surveyed reach included flats, runs and pools. Substrate composition consisted of fine material (silt and sand) with sparse cobble which has deposited over the concrete liner. Instream cover was low and consisted of small woody debris and algae. Small-bodied fish were observed throughout the reach. Several barriers to fish migration were observed, including a debris pile (Photo 24) and steep drops (Photo 30) created by water control structures incorporated into the concrete channel. Banks were stable throughout the reach, and consistent in slope, bankfull width and height due to the design of the concrete liner. Based on the observations in the field, the reach is providing nursery habitat for small-bodied fish. No sensitive features, overwintering habitat, or spawning habitat was observed.

Kenollie Creek enters the site from the northwest before turning southwest and flowing along the southwestern boundary of the site and eventually emptying into the Credit River Marshes PSW Complex approximately 150 m southwest of the site (Figure 4). Similar to Mary Fix Creek, the surveyed portion of Kenollie Creek is also constructed of a concrete channel. As depicted in Photo 27, the water level was low at the time of the survey, resulting in very shallow conditions within Kenollie Creek. The shallow conditions combined with the steep section of channel as it enters Mary Fix Creek resulted in a fish migration barrier.

The suite of wildlife species found at this location was expected and typical of urban environments, and isolated natural areas, and included species such as northern cardinal (*Cardinalis cardinalis*), black-capped chickadee (*Poecile atricapillus*), downy woodpecker (*Picoides pubescens*), golden-crowned kinglet, and northern flicker (*Colaptes auratus*). Given the timing of the site reconnaissance (i.e., in October, outside of the core breeding period for wildlife) all birds were observed during migration and therefore observations are not an indication of suitable breeding habitat.

Representative photos are provided (Photos 19-30).

Photo 29: Mary Fix Creek.

Photo 30: Steep drop in concrete channel creating fish migration barrier in Mary Fix Creek.

5.4 East Shaft

The Lakeshore Road East - Municipal Parking Lot (East Shaft) is located at the intersection of Elmwood Avenue North and Lakeshore Road East with associated commercial and residential areas of Port Credit nearby (Figure 5). This municipal parking lot supports no natural features and is proposed to be used as a staging area. Natural areas are limited to a small mature woodlot directly to the south of the shaft site. This woodlot is fenced, and so was surveyed from the roadside only. The woodlot comprises a Red Oak Deciduous Forest (FOD1-1) community dominated by mature red oak in the canopy layer, with abundant Norway maple and green ash in the subcanopy.

No wildlife was observed at this shaft location during field investigations; however, wildlife species common in urban environments and isolated natural areas, similar to those observed at the other sites, are likely present.

Representative photos are provided (Photos 31-34).

Photo 31: View of the northeastern part of the Red Oak Forest along Elmwood Ave.

Photo 32: View of the southern part of the Red Oak Forest along St Lawrence Ave.

Photo 33: View of the Red Oak Forest along Lakeshore Rd E.

Photo 34: View of the Red Oak Forest along Lakeshore Rd E.

5.5 West Shaft

The Lakeshore Road West - Marina Park (West Shaft) is located at the intersection of Lakeshore Road West and Front Street North, with associated commercial properties nearby (Figure 6). Natural areas are limited to an area of Constructed Parkland (CGL_2) along the Credit River. The Constructed Parkland community comprises primarily planted non-native tree and shrubs, and ground layer species. Manitoba maple and Norway maple are abundant, with occasional Siberian elm (*Ulmus pumila*), tree of heaven (*Ailanthus altissima*), black walnut, green ash, and littleleaf linden. The ground layer consists primarily of mown grass; however, a variety of native and non-native species are present closer to the adjacent Credit River. The area shows significant evidence of anthropogenic disturbance including recreational use, invasive species, trails, fishing, and dumping.

The suite of wildlife species found at this location was expected and typical of urban environments, lakeshore habitat, and isolated natural areas, and included species such as Canada goose, mallard, and ring-billed gull. Given the timing of the site reconnaissance (i.e., in October, outside of the core breeding period for wildlife) all birds were observed during migration and therefore observations are not an indication of suitable breeding habitat.

Representative photos are provided (Photos 35-38).

6.0 ASSESSMENT OF SENSITIVE NATURAL HERITAGE FEATURES

6.1 Areas of Natural and Scientific Interest

Areas of Natural and Scientific Interest (ANSI) are designated by the province according to standardized evaluation procedures. ANSI are ranked by the Ministry of Natural Resources and Forestry (MNRF) as being either provincially or regionally significant.

There are no ANSI overlapping any of the sites (NHIC 2021). Off-site, there is a regionally significant life science ANSI known as the Credit River Coastal Marshes approximately 105 m southwest of the Rosemere site (Figure 4). Regionally significant life science ANSI are identified as a Significant Natural Area by the City (City of Mississauga 2023). Where development is proposed in or adjacent to a regionally significant life science ANSI, an assessment must be completed to demonstrate that all reasonable alternatives have been considered and development will not adversely affect the feature or its ecological function, to the satisfaction of the City (City of Mississauga 2023).

6.2 Significant Wetlands

A wetland is determined to be a PSW by the MNRF using evaluation procedures established by the Province, as amended from time to time (MMAH 2020). Wetlands are evaluated for significance based on a range of criteria, including biology, hydrology, societal value and special features (MNRF 2013).

There are no mapped PSWs, other evaluated wetlands, or unevaluated wetlands overlapping any of the sites, or their respective study areas (NHIC 2021). According to City of Mississauga mapping, the southern portion of the Rosemere site overlaps the 120 m buffer zone associated with the Credit River Marshes PSW Complex (City of Mississauga 2023 – OP Schedule 3). However, based on provincial mapping, the Rosemere site is located approximately 150 m northeast of the complex (NHIC 2021; Figure 4).

6.3 Significant Woodlands

Significant woodlands are areas which are: 1) ecologically important in terms of features such as species composition, age of trees, and stand history; 2) functionally important due to their contribution to the broader landscape because of their location, size, or due to the amount of forest cover in the planning area; or 3) economically important due to site quality, species composition, or past management history (MMAH 2020).

The City of Mississauga has identified significant woodlands in its jurisdiction under the Significant Natural Areas overlay (City of Mississauga 2023 – OP Schedule 3). A Significant Natural Area overlaps the Rosemere site where it intersects deciduous forest (Figure 4), suggesting woodland significance. City of Mississauga mapping groups Significant Natural Areas with Natural Green Spaces. An area identified as such overlaps the west shaft (Marina Park) study area but not the site (Figure 6). The area is across the Credit River from the shaft site and based on land cover is likely a Natural Green Space rather than a Significant Natural Area.

Where development is proposed in or adjacent to a significant woodland, an assessment must be completed to demonstrate that all reasonable alternatives have been considered and development will not adversely affect the feature or its ecological function, to the satisfaction of the City (City of Mississauga 2023). Vegetated setbacks may be required from the woodland dripline of significant woodlands and are determined on a case-by-case basis.

Significant woodlands are also contained within the Core Areas designation of the Greenlands System as mapped by the Region of Peel (2022). There are no Core Areas of the Greenlands System present within any of the sites or study areas.

6.4 Significant Valleylands

General guidelines for determining significance of valleylands are presented in the Natural Heritage Reference Manual (NHRM; MNR 2010). Recommended criteria for designating significant valleylands include prominence as a distinctive landform, degree of naturalness, importance of its ecological functions, restoration potential, and historical and cultural values. According to the City of Mississauga (2023), significant valleylands are associated with the main branches, major tributaries and other tributaries and watercourse corridors draining directly to Lake Ontario including the Credit River, Etobicoke Creek, and Mimico Creek. These features are generally included in the Significant Natural Areas overlay in the OP (City of Mississauga 2023 – OP Schedules 3 and 10).

The west shaft site at Marina Park along Lakeshore Road West occurs adjacent to, but not within, Natural Hazard Lands associated with the Credit River (Figure 6). The Credit River is one of the main rivers draining into Lake Ontario and is identified as a Significant Valleylands by the City of Mississauga (2023).

Additionally, Natural Hazard Lands associated with Mary Fix Creek and Kenollie Creek overlap the Rosemere site (Figure 4). Given that these creeks are small tributaries that do not drain directly into Lake Ontario, the valleylands associated with the creeks are unlikely to be considered significant.

Valleys and hazard lands are generally regulated by the local conservation authority (in this case, CVC) and development within or adjacent to these features is subject to common permitting policies (CVC 2010).

6.5 Habitat for Endangered and Threatened Species

General habitat protection is provided by the ESA to all threatened and endangered species. General habitat is defined as the area on which a species depends directly or indirectly to carry out life processes, including reproduction, rearing, hibernation, migration, or feeding (Ontario 2007). Species-specific habitat protection is only afforded to those species for which a habitat regulation has been prepared and passed into law as a regulation of the ESA. A habitat regulation outlines specific habitat features and associated buffers that are protected, and also specifies the geographic area(s) of the province where the habitat regulation applies. In some cases, a General Habitat Description (GHD) may also be prepared to help define and refine the area of protected habitat in advance of a habitat regulation.

Development and site alteration in habitat of endangered and threatened species is prohibited, except in accordance with provincial requirements under the ESA. Policies in the applicable provincial and municipal plans align with and defer to provincial requirements under the ESA.

Potential as habitat for endangered or threatened species is provided in Table 1 below; however, further field investigations need to be conducted to collect field data at each site to confirm the presence of potential habitat and its use by SAR. Only species with moderate potential to occur at one or more sites or within their respective study areas are discussed. A full evaluation of habitat potential for SAR and description of habitat preferences is provided in the SAR screening (Appendix A).

Table 1: Endangered and Threatened Species with Moderate or High Potential to Occur on the Sites and/or in the Study Areas

Common Name	Scientific Name	ESA[1]	Site(s)[2]	Potential to Occur[2]	Rationale for Potential to Occur
Chimney Swift	*Chaetura pelagica*	THR	▪ Elmwood, Hiawatha, Rosemere, West Shaft, East Shaft (off-site in study area)	Moderate	There are no structures or large cavity trees that may provide suitable nesting habitat on the sites. Off-site, chimneys in residential and commercial areas in all study areas may provide suitable nesting and roosting habitat. This species is likely to be present as foraging visitors.
Red-headed Woodpecker	*Melanerpes erythrocephalus*	END	▪ Elmwood (site) ▪ Hiawatha (site) ▪ Rosemere (site and study area) ▪ East shaft (off-site in study area)	Moderate	Large oak trees observed throughout the Elmwood and Hiawatha sites may provide suitable nesting habitat. The deciduous forest overlapping the Rosemere site and study area, and the deciduous forest immediately south of the east shaft site, may provide suitable nesting habitat for this species.
Butternut	*Juglans cinerea*	END	▪ Elmwood (site) ▪ Rosemere (off-site in study area)	High	The small woodland patch in the northern portion of the Elmwood site could provide the suitable growing conditions for butternut. No individuals were observed during the site reconnaissance, but a detailed botanical inventory was not conducted due to access restrictions. Off-site portions of the deciduous forest overlapping the Rosemere site and study area may provide suitable growing conditions for this species. No butternuts were observed in the on-site portion of the deciduous forest.
Kentucky coffee-tree	*Gymnocladus dioicus*	THR	▪ Elmwood (site)	High	Planted Kentucky coffee-trees were observed in the centre of the Elmwood site. Planted specimens are not protected under the ESA. This species is an increasingly common planted urban tree in southern Ontario.

Notes:

[1] Endangered Species Act (ESA), 2007 (O.Reg 242/08 current to 8 September 2023). Species at Risk in Ontario List, 2007 (O.Reg 230/08 current to 8 September 2023); Schedule 1 (Extirpated - EXP), Schedule 2 (Endangered - END), Schedule 3 (Threatened - THR), Schedule 4 (Special Concern - SC)

[2] Sites are only listed where habitat potential is moderate or high on the site or in its respective study area. It can be assumed that there is low potential for habitat for the species in the remaining sites and their respective study areas.

6.6 Significant Wildlife Habitat

There are four general categories of significant wildlife habitat (SWH): seasonal concentration areas; rare vegetation communities or specialized habitat for wildlife; habitat for species of conservation concern; and animal movement corridors. Each category is further broken down into specialized habitat types. The specific habitats considered in this report are evaluated based on the criteria outlined in the Ecoregion 7E criterion schedules (MNRF 2015).

The NHRM includes criteria and guidelines for designating SWH. There are two other documents, the Significant Wildlife Habitat Technical Guide (SWHTG) and the Significant Wildlife Habitat Mitigation Support Tool (SWHMiST) (MNR 2000 and MNRF 2014), that can be used to help decide what areas and features should be considered significant wildlife habitat. These documents were used as reference material for this study. SWH should be evaluated in the context of the entire planning authority's jurisdiction, and only the best examples are considered significant (MNR 2000).

Although SWH is typically identified on a site-specific basis and is therefore not often mapped at a landscape level in municipal OPs, according to the OP (City of Mississauga 2023), SWH in the City is generally contained within the Significant Natural Areas overlay (OP Schedule 3; Figure 1). A Significant Natural Area overlaps with the Rosemere site and study area, suggesting the potential presence of SWH. City of Mississauga mapping groups Significant Natural Areas with Natural Green Spaces. An area identified as such overlaps the west shaft (Marina Park) study area but not the site (Figure 6). The area is across the Credit River from the shaft site and based on land cover is likely a Natural Green Space rather than a Significant Natural Area.

Based on the reference documents listed above, potential for SWH is discussed by site in Table 2. Only SWH types with potential to occur on the sites and/or within the study areas are discussed.

Table 2: Significant Wildlife Habitat with Potential to Occur on the Sites and/or in the Study Areas

Significant Wildlife Habitat General Category	Specialized Habitat Type	Site(s)[1]	Rationale for Potential to Occur
Habitat for Species of Conservation Concern	Habitat of special concern and rare wildlife species: monarch (*Danaus plexippus*)	▪ Elmwood (site) ▪ Hiawatha (site) ▪ Rosemere (site and study area) ▪ West shaft (site and study area) ▪ East shaft (off-site in study area)	All of the identified sites provide suitable foraging habitat, and breeding habitat (i.e., presence of milkweed) was confirmed on the Rosemere site and in the east shaft study area (off-site). One adult butterfly was observed at the Hiawatha site during the October 2022 field reconnaissance. However, suitable habitat for this species is well-represented throughout the broader region. This constitutes **Candidate SWH**
	Habitat of special concern and rare wildlife species: eastern wood-pewee (*Contopus virens) and* wood thrush (*Hylocichla mustelina)*	▪ Rosemere (site and study area)	The deciduous forest overlapping the Rosemere site and study area may provide suitable nesting habitat for these species. This constitutes **Candidate SWH**
Animal Movement Corridors	Amphibian movement corridors	▪ Rosemere (site and study area)	Kenollie Creek and Mary Fix Creek in the Rosemere site and study area may offer movement opportunities for amphibians travelling to/from the Credit River Marshes PSW Complex approximately 150 m southwest of the site. The presence of this habitat is not confirmed as appropriately timed surveys have not been conducted. This constitutes **Candidate SWH**

Notes:

[1] Sites area are only listed where there is potential occurrence of significant wildlife habitat on the site or its respective study area. Remaining sites can be assumed to lack potential.

6.7 Surface Water Features

Surface water features in the vicinity of the sites are part of the Credit River watershed (MNR and CVC 2002). The CVC regulates watercourses, waterbodies, and wetlands in the Credit River watershed. Lake Ontario borders the Elmwood and Hiawatha sites to the southeast. The CVC regulation limits associated with Lake Ontario overlap the southern portions of the Elmwood and Hiawatha sites (Figures 2 and 3). Kenollie Creek overlaps the Rosemere site and Mary Fix Creek borders the Rosemere site (Figure 4). The CVC regulation limits associated with these creeks overlap the Rosemere site. The west shaft site at Marina Park borders the Credit River and is within the CVC regulation limits associated with the river (Figure 6). Any development proposed within CVC regulation limits will require authorization or a permit from the CVC.

6.8 Fish Habitat

The nearshore zone of Lake Ontario within the study areas of Elmwood and Hiawatha is considered warmwater (Stewart et al. 2013). There are numerous native and non-native fish species present in Lake Ontario such as top predator coldwater salmonids (chinook [*Oncorhynchus tshawytscha*], coho [*Oncorhynchus kisutch*], and Atlantic salmon [*Salmo salar*]; rainbow [*Oncorhynchus mykiss*], brook [*Salvelinus fontinalis*], lake [*Salvelinus namaycush*] and brown trout [*Salmo trutta*]), warmwater species such as brown bullhead (*Ameiurus nebulosus*) and sunfish, and various sportfish such as walleye (*Sander vitreus*), northern pike (*Esox lucius*), muskellunge (*Esox masquinongy*), smallmouth bass (*Micropterus dolomieu*), and largemouth bass (*Micropterus salmoides*). Numerous invasive species are found in the lake including zebra and quagga mussels (*Dreissena* spp.), predatory zooplankton (spiny water flea [*Bythotrephes longimanus*] and fish-hook flea [*Cercopagis pengoi*]), round goby (*Neogobius melanostomus*), tubenose goby (*Proterorhinus semilunaris*), and sea lamprey (*Petromyzon marinus*) (Stewart et al. 2013). Although two dead American eel individuals were observed washed up on the shoreline at the Elmwood site, the nearshore zone of Lake Ontario does not have suitable characteristics to be habitat for this species.

The Credit River is characterized as having a coldwater thermal regime, and the following species are documented in the watercourse: black crappie (*Pomoxis nigromaculatus*), brook trout, brown bullhead (*Ameiurus nebulosus*), brown trout, coho salmon, common carp (*Cyprinus carpio*), freshwater drum (*Aplodinotus grunniens*), largemouth bass, northern pike, pumpkinseed (*Lepomis gibbosus*), rainbow smelt (*Osmerus mordax*), rainbow trout, rock bass (*Ambloplites rupestris*), smallmouth bass, white bass (*Morone chrysops*), white perch (*Morone americana*), white sucker (*Catostomus commersonii*), and yellow perch (*Perca flavescens*) (MNRF 2022).

Kenollie Creek and Mary Fix Creek are characterized as having a warmwater thermal regime, and the following warmwater species are documented to have habitat in these features: brown bullhead and goldfish (*Carassius auratus*) (MNRF 2022). Warmwater watercourses and waterbodies are generally considered to be more robust and tolerant to external effects.

Where development is proposed within or adjacent (i.e., within 30 m) to fish habitat, an impact assessment must be completed to demonstrate that development will not adversely affect the feature or its ecological function. In general, development should be designed to avoid or minimize adverse impacts to fish and fish habitat. Development and site alteration within fish habitat may be permitted in accordance with provincial and federal requirements. Buffers to protect against soil erosion and sediment impacts may be required for development and site alteration adjacent to waterbodies (City of Mississauga 2023).

6.9 Official Plan Designated Features

6.9.1 Natural Hazard Lands

According to the City of Mississauga (2023), Natural Hazard Lands are associated with stream corridors and the Lake Ontario shoreline and determined to be unsafe for development due to natural processes such as flooding and erosion. Natural Hazard Lands are mapped on Schedules 3 and 10 of the OP.

Natural Hazard Lands associated with the Lake Ontario shoreline overlap the southern portions of the Elmwood and Hiawatha sites (Figures 2 and 3). Natural Hazard Lands associated with Kenollie Creek and Mary Flix Creek overlap the Rosemere site (Figure 4). Natural Hazard Lands associated with the Credit River overlap the west shaft study area but not the site (Figure 6).

Where development is proposed within Natural Hazard Lands, uses must be limited to essential infrastructure, conservation, flood and erosion control, and passive recreation. Development will not be permitted unless it meets the requirements of the CVC and City policies (e.g., Erosion and Sediment Control by-law). However, development may be permitted within hazard lands if an assessment is completed to demonstrate that alternatives have been considered and development will not adversely affect the feature or its flood and erosion control function, to the satisfaction of the CVC (CVC 2010).

6.9.2 Residential Woodlands

According to the City of Mississauga (2023), Residential Woodlands are areas, generally in older residential areas, with large lots that have mature trees forming a relatively continuous canopy but with minimal native understorey due to landscaping practices.

The Rosemere site is designated by the City as Residential Woodlands (City of Mississauga 2023 - OP Schedule 3).

Development within Residential Woodlands will have regard for how the existing tree canopy and understorey are protected and enhanced. A site development plan may be required to demonstrate the maintenance of various characteristics including topography and drainage patterns, groundwater recharge, habitat for tolerant canopy birds and urban wildlife (City of Mississauga 2023).

7.0 IMPACT ASSESSMENT

An assessment of the impacts of the proposed works on sensitive natural heritage features is outlined in this section of the report, based on the preliminary design of the preferred solution. Direct impacts (i.e., Project footprint disturbance) as well as potential indirect or secondary impacts (e.g., sensory disturbance) were considered.

Sensitive natural heritage features identified within one or more study areas are assessed for Project impacts below.

7.1 Areas of Natural and Scientific Interest

The Credit River Coastal Marshes ANSI is approximately 105 m southwest of the Rosemere site (Figure 4). However, the ANSI is separated from the Rosemere site by Stavebank Road and suburban residences and therefore is not anticipated to be impacted by the Project.

7.2 Significant Woodlands

Direct impacts to the significant woodland identified at the Rosemere site (primarily surrounding Kenollie Creek) are anticipated to be minimal as the majority of the area identified as significant is outside of the site, and therefore tree removals within the significant woodland will be minimal. Additionally, the proposed works will be completed using trenchless methods by horizontal directional drilling (HDD), avoiding significant impacts to trees. Indirect impacts to adjacent retained vegetation during and following construction may include:

- Release of construction-generated sediment to adjacent habitats.
- Vegetation clearing/damage beyond the working area.
- Increased potential for introduction of non-native species.
- Spills of contaminants, fuels and other materials that may reach natural or semi-natural areas.
- Changes in drainage patterns (groundwater and/or surface runoff flow) that can impact dependent vegetation/wetland areas located either upgradient or downgradient of the impacted area. Blocking of existing surface/subsurface drainage patterns can result in upstream and downstream vegetation dieback/condition changes; an increase in downstream runoff can result in erosion impacts on receiving vegetation.

These potential impacts can be avoided or minimized through the implementation of mitigation measures identified in Section 8.1.

7.3 Significant Valleylands

Given that the Credit River Significant Valleylands have a large and defined valleylands, and the area of proposed disturbance is limited to one crossing using trenchless tunnelling, the Project is not expected to have any negative impacts on the overall morphology and function of the valleylands.

The Credit River Significant Valleylands and the west shaft site at Marina Park are within CVC regulation limits and the Project will require a permit for development to occur within these regulated areas. General mitigation measures to minimize impacts to the Credit River and its valleylands are provided in Sections 8.1, and additional mitigation measures will be determined in consultation with the CVC as part of the permitting process.

7.4 Habitat for Endangered and Threatened Species

There is moderate to high potential for four threatened or endangered species to occur within one or more of the study areas, as discussed in Section 6.5 above. Potential impacts to each SAR are discussed below.

Table 3: Species at Risk Impact Assessment

Common Name	ESA	Site(s)	Impact Assessment
Chimney Swift	THR	▪ Elmwood, Hiawatha, Rosemere, West Shaft, East Shaft (off-site in study area)	There is moderate potential for chimney swift to be present within the sites and study areas; however, no direct impacts to this species are anticipated. Suitable nesting habitat is not present within any of the sites, and no building removals are proposed. Chimney swifts are unlikely to be impacted as foraging visitors and impacts to foraging habitat will be minimal and temporary. Mitigation measures outlined in Section 8.2 are anticipated to be sufficient to protect this species.
Red-headed Woodpecker	END	▪ Elmwood (site) ▪ Hiawatha (site) ▪ Rosemere (site and study area) ▪ East shaft (off-site in study area)	There is moderate potential for red-headed woodpecker to be present within the sites and study areas; however, no direct impacts to this species are anticipated. Potential impacts to suitable breeding habitat are limited, as most impacts to large tree will be avoided by trenchless construction methods. Impacts to foraging habitat will be minimal and temporary. Mitigation measures outlined in Section 8.2 are anticipated to be sufficient to protect this species.
Butternut	END	▪ Elmwood (site) ▪ Rosemere (off-site in study area)	Although this species was assessed as having high potential to occur, no individuals were observed and therefore no direct impacts are anticipated. Indirect impacts to unidentified individuals in areas inaccessible during field work are possible, and general vegetation mitigation measures are outlined in Section 8.1 to protect these individuals.
Kentucky coffee-tree	THR	▪ Elmwood (site)	As noted in Section 5.1, planted Kentucky coffee-trees were observed in the centre of the Elmwood site; however, the ESA only applies to naturally occurring specimens. Cultivated and natural hybrids, as well as nursery grown or planted trees, do not qualify for protection unless they are part of a MECP approved restoration program. Within the Elmwood site, all observed Kentucky coffee-tree specimens were intentionally planted nursery stock and therefore are not protected. Habitat for naturally occurring individuals or populations is not present within the study area.

7.5 Significant Wildlife Habitat

Candidate SWH is present for monarch, eastern wood-pewee, wood thrush, and a potential for amphibian movement corridors, as discussed in Section 6.6 above. Potential impacts to each candidate SWH are discussed below.

Table 4: Significant Wildlife Habitat Impact Assessment

Significant Wildlife Habitat General Category	Specialized Habitat Type	Site(s)[1]	Impact Assessment
Habitat for Species of Conservation Concern	**Candidate** Habitat of special concern and rare wildlife species: monarch (*Danaus plexippus*)	▪ Elmwood (site) ▪ Hiawatha (site) ▪ Rosemere (site and study area) ▪ West shaft (site and study area) ▪ East shaft (off-site in study area)	Impacts to habitat will be minor in area and temporary as these areas will be restored to a similar condition following construction. Habitat for this species is not limited in the broader region. Measures to mitigate potential impacts to this candidate SWH are outlined in Section 8.3.
	Candidate Habitat of special concern and rare wildlife species: eastern wood-pewee (*Contopus virens)* and wood thrush (*Hylocichla mustelina)*	▪ Rosemere (site and study area)	Impacts to potential breeding and foraging habitat are anticipated to be minimal, as significant impacts to large trees/forest are not anticipated due to the trenchless construction methods. Impacts to foraging habitat will be minor in area and temporary as these areas will be restored to a similar condition following construction. Direct impacts to individuals can be sufficiently avoided with the implementation of the mitigation measures outlined in Section 8.2.
Animal Movement Corridors	**Candidate** Amphibian movement corridors	▪ Rosemere (site and study area)	The presence of this habitat has not been confirmed; additional studies may be required at later design phase to further quantify impacts. Potential impacts are anticipated to be small in area as the use of trenchless construction methods will avoid impacts to the treed area potentially supporting a movement corridor. However, impacts are possible within the planned staging area in the northeastern quadrant of Rosemere Road and Stavebank Road, including the creation of barriers to movement (e.g., the presence of excessive downed woody debris from tree clearing), as well as the opening of the woodland canopy that will dry the moist microclimate, rendering the corridor unsuitable for amphibian movement. Should this habitat be confirmed, mitigation measures will be developed during the detailed design phase.

7.6 Surface Water Features

The Rosemere site is within CVC regulation limits of Kenollie Creek and Mary Fix Creek, the Elmwood and Hiawatha sites are within CVC regulation limits of Lake Ontario, and the west shaft site at Marina Park is within CVC regulation limits of the Credit River. The Project will require a permit for development to occur within these regulated areas. General mitigation measures to minimize impacts to these surface water features are provided in Sections 8.1, and additional mitigation measures will be determined in consultation with the CVC as part of the permitting process.

7.7 Fish Habitat

Construction activities involved in carrying out the tunneling construction activities at Kenollie Creek and the construction in the vicinity of Mary Fix Creek, Lake Ontario and the Credit River have the potential to impact fish and fish habitat through indirect pathways. No direct impacts are anticipated as tunnelling will be used to cross Kenollie Creek. Potential Project activities that may occur near water were reviewed to identify applicable Pathways of Effects (DFO 2018) and include potential effects from the following:

- Use of industrial equipment
- Heavy equipment used during construction has the potential to increase bank instability and lead to the potential for sediment laden runoff entering the watercourses or lake
- Equipment leaks can lead to contaminants entering the watercourses or lake
  - Potential for indirect or direct effects to fish, eggs and larvae as a result of using industrial equipment below the highwater mark at Kenollie Creek
- Vegetation clearing/grading and excavation
  - The removal of vegetation and disturbance of soils can lead to bank instability and create the potential for sediment laden runoff to enter the watercourse unless properly managed
  - Removal of vegetation may change habitat structure and cover, change nutrient concentrations, and change water temperatures due to removal of shading

As the Project work involves work near water, which is fish habitat under the *Fisheries Act*, a DFO Request for Review (RFR) is required.

7.8 Official Plan Designated Features

7.8.1 Natural Hazard Lands

An evaluation of alternatives for this essential infrastructure Project was conducted and the preferred solution detailed in Section 3.0 was deemed to be the most fitting from an environmental and technical standpoint. Natural Hazard Lands identified within the Elmwood, Hiawatha, and west shaft study areas will not be impacted as works are not proposed in the Natural Hazard Land areas. At the Rosemere site, a relatively small portion of the Natural Hazard Lands will be impacted by the proposed works where staging is planned in the northeastern quadrant of Rosemere Road and Stavebank Road. Impacts are anticipated to be small in area, given the trenchless construction methods, and medium-term given the removal of mature trees.

Mitigation measures for the protection of the Natural Hazard Lands are provided in Section 8.5. With the implementation of the mitigation measures, the proposed development is not anticipated to adversely affect the feature or its flood and erosion control function in the long-term. Further mitigation measures may be identified by CVC as part of the permitting process.

7.8.2 Residential Woodlands

Direct impacts to this residential woodland at the Rosemere site are anticipated to be minimal as significant impacts to trees will be avoided through the use of trenchless construction methods by HDD. There is some potential for the residential woodland to be impacted indirectly, as discussed in Section 7.2. A site development plan may be required to demonstrate the maintenance of various characteristics including topography and drainage patterns, groundwater recharge, habitat for tolerant canopy birds and urban wildlife (City of Mississauga 2023). Mitigation measures for protection of this residential woodland are provided in Section 8.1.

8.0 MITIGATION

8.1 General Best Management Practices

General best management practices to be followed during site preparation and construction to mitigate damage to natural features include the following:

- Where possible, minimize the Project footprint and duration during the detailed design phase.
- Clearly demarcate and maintain site boundaries to prevent encroachment into adjacent natural features.
- Ensure all equipment is cleaned prior to transportation and maintained free of fluid leaks, for use on the sites to avoid the spread or introduction of invasive species, or noxious weeds.
- Avoid the storage of construction materials or equipment adjacent to sensitive natural features (e.g., woodland) to minimize disturbance to these features and resident wildlife.
- Exposed surfaces should be re-stabilized and revegetated as soon as possible following disturbance, specifically within 15 days near watercourses and within 45 days in graded areas. Consider revegetating with CVC seed mix 3 (Lowland Restoration Mix) for low-lying areas and CVC Seed Mix 1 (Upland Mix) for upland areas to ensure each ecosite is returned to pre-construction condition or better. Seed mix and cover crop details are provided in the CVC Plant Selection Guideline (CVC 2018).
- Implement standard practices such as a grading plan, drainage plan, sediment and erosion controls, spill prevention, etc. during the construction phase of the Project.
- Appropriate vegetation clearing techniques will be used (e.g., felling trees away from retained natural areas and watercourses).
- Cut and grubbed material shall be disposed of through chipping or other appropriate means.
- Dust control shall be completed using water, not chemical suppressants.
- Environmental inspection during construction is recommended to ensure that all mitigation measures are implemented properly, maintained and repaired. Remedial measures are to be initiated in a timely manner where warranted.

8.2 Migratory Birds

In order to protect nesting migratory birds in accordance with the MBCA, the following mitigation measures shall be implemented:

- Vegetation removal (including grubbing and removal of trees, shrubs, grasses and plants) will be avoided during the identified migratory bird nesting season (April 5 to August 26 in nesting zone C2; ECCC 2023) to the extent possible. If the nesting season cannot be avoided, construction disturbance will be preceded by a nesting survey conducted by a qualified biologist. If any active nests are found during the nesting survey, a buffer will be installed around the nest to protect against disturbance. Vegetation within the protection buffer cannot be removed until the young have fledged the nest.
- No active nests (nests with viable eggs or young birds) will be removed or disturbed in accordance with the MBCA.
- If a nesting migratory bird is identified within or adjacent to the construction site and the construction activities are such that continuing construction in that area would result in a contravention of the MBCA, all activities will stop, and a qualified biologist will be contacted to discuss mitigation options.
- Activities resulting in major noise and vibration levels will be avoided during the migratory bird nesting period (April 5 to August 26 in nesting zone C2; ECCC 2023) to the extent possible.

8.3 Significant Wildlife Habitat

Monarch

- To address the impacts to monarch habitat, and to enhance existing meadow habitat for these species, consider re-vegetating disturbed areas with native seed mix including native milkweed species (to provide critical larval life stage habitat for monarch) and wildflowers (to provide nectar-producing plants for adult monarch foraging).

8.4 Fish and Fish Habitat

Measures to be followed to mitigate negative indirect impacts to Kenollie Creek, Mary Fix Creek, Credit River and Lake Ontario include the following:

- Conduct near water work during a period of low flow and avoid wet, windy, and rainy periods.
- Install sediment and erosion controls (e.g., silt fencing) along the extent of the construction disturbance footprint prior to commencement of site preparation and construction activities to prevent sediment from entering the watercourse.
- Manage water flowing onto the site such that sediment is filtered out prior to the water entering the watercourse (e.g., rainfall).
- Regularly inspect and maintain the sediment and erosion controls.
- Develop a response plan that will be implemented immediately in the event of a sediment release or spill of a deleterious substance and an emergency spill kit will be kept on the site.
- Wash, refuel, and service equipment away from the watercourse (i.e., >30 m distance).

- Plan activities near water such that chemicals do not enter the watercourse.
- Minimize depth of excavation, where possible.
- Minimize organic debris (e.g., woody debris) clearing and use proper clearing techniques. Salvage and replace organic debris areas to pre-construction condition.
- Store and stabilize all stockpiled materials, including but not limited to excavated overburden and topsoil, excess materials, construction debris and containers in a manner that will prevent the release of leaching of substances that may be deleterious to fish from entering any watercourse.
- Revegetate cleared and disturbed areas and armour exposed soils on watercourse banks to pre-construction condition to minimize exposed soils and therefore erosion potential. Revegetate cleared areas with native species that were removed. Rehabilitate and re-contour land to pre-construction condition.

A DFO Request for Review will be required for the Project. Dependant upon the type of work being undertaken, residual effects of the Project that may result in the harmful alteration, disruption or destruction to fish habitats and/or as a result of the DFO review process, a DFO Fisheries Act Authorization for the Project may be required. Mitigation measures identified therein are expected to be adhered to.

8.5 Natural Hazard Lands

Measures to be followed to mitigate negative impacts to Natural Hazard Lands include the following:

- General best management practices outlined in Section 8.1 will be adhered to.
- Tree removals will be minimized / avoided wherever possible to maintain the treed area of Natural Hazard Lands to the extent possible.
- Upon completion of construction, the staging area will be restored / revegetated with native deciduous trees and shrubs appropriate to local ecological context.

9.0 CONCLUSIONS

The proposed Project has been assessed for potential ecological impacts under the policies of the City of Mississauga (2023), as well as other relevant legislation and policy, including the ESA and PPS (MMAH 2020a). Based on this assessment, it is expected that there will be medium-term negative impacts to the Rosemere Natural Hazard Area through the removal of small portions of the woodlands for staging. However, following rehabilitation of these woodlands it is expected that the form and functions of these woodlands will be restored. Temporary impacts are also expected to Significant Valleylands but are expected to be minor given the short duration of disturbance and other mitigation in place. These conclusions are based on the following recommendations:

- All mitigation measures detailed in Section 8.0 will be implemented.
- A DFO Request for Review will be submitted for work being completed near water at the Rosemere, Elmwood, Hiawatha and west shaft (Marina Park) sites. Dependant upon the type of work being undertaken, residual effects of the Project that may result in the harmful alternation, disruption, or destruction to fish

habitats and/or as a result of the DFO review process, a DFO Fisheries Act Authorization for the Project may be required.

- As work is being completed within CVC regulation limits at the Rosemere, Elmwood, Hiawatha and west shaft (Marina Park) sites, permits from CVC will be obtained for development to proceed, and all mitigation requirements identified in the permits will be implemented.
- Should SWH be confirmed on any of the sites, and the habitat is expected to be disturbed by the proposed construction activities, appropriate mitigation measures will be developed to avoid or eliminate impacts.
- Should habitat for any potential threatened / endangered SAR listed above be confirmed on any of the sites, and the habitat is expected to be disturbed by the proposed construction activities, authorization (registration or permitting) under the ESA will be obtained.

For all sites, a mitigation plan should be refined at the detailed design phase to ensure impacts to all identified features are avoided or minimized. The mitigation plan may involve monitoring of mitigation measures (e.g., erosion and sediment controls), impacts during construction, and long-term impacts following construction and/or restoration of impacted areas. To facilitate this mitigation plan, the following additional studies may be required at the detail design phase to confirm the presence of sensitive natural heritage features or species:

- Targeted field surveys are recommended at the Rosemere site to confirm amphibian movement corridors.
- Breeding bird surveys are recommended at all sites to confirm SAR habitat and SWH.

10.0 LIMITATIONS

The results of this report are based on information available to WSP at the time of the review, and the status of species listed in the noted Acts and Regulations effective as of the date of this technical memo. Limited field investigations by qualified biologists have been conducted to confirm the presence of significant features or habitat, and the review may be subject to limitations associated with base mapping and other publicly available information used.

11.0 CLOSURE

We trust this report meets your current needs. If you have any further questions regarding this report, please contact the undersigned.

APPENDIX A

Species At Risk Screening

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Amphibian	Jefferson salamander	*Ambystoma jeffersonianum*	END	END	END	S2	In Ontario, Jefferson salamander is found only in southern Ontario, along southern portions of the Niagara Escarpment and western portions of the Oak Ridges Moraine. Jefferson salamander prefers moist, well-drained deciduous and mixed forests with a closed canopy. It overwinters underground in mammal burrows and rock fissures and moves to vernal pools and ephemeral wetlands in the early spring to breed. Breeding ponds are typically located in or near to forested habitats, and contain submerged debris (i.e., sticks, vegetation) for egg attachment sites. Ephemeral breeding pools need to have water until at least mid-summer (mid to late July) (Jefferson Salamander Recovery Team 2010).	Low	Low	There is no suitable forest or wetland habitat in any of the study areas.
Arthropod	Monarch	*Danaus plexippus*	SC	SC	END	S2N, S4B	In Ontario, monarch is found throughout the northern and southern regions of the province. This butterfly is found wherever there are milkweed (Asclepias spp.) plants for its caterpillars and wildflowers that supply a nectar source for adults. It is often found on abandoned farmland, meadows, open wetlands, prairies and roadsides, but also in city gardens and parks. Important staging areas during migration occur along the north shores of the Great Lakes (COSEWIC 2010).	Moderate (Elmwood) (Rosemere) (West Shaft) High (Hiawatha)	Moderate (Elmwood) (Hiawatha) (Rosemere) (West Shaft) (East Shaft)	All of the identified sites provide suitable foraging habitat, and breeding habitat (i.e., presence of milkweed) was confirmed on the Rosemere site and in the east shaft study area (off-site). One adult butterfly was also observed on the Hiawatha site during the October 2022 field reconnaissance.
Arthropod	Mottled duskywing	*Erynnis martialis*	END	—	END	S2	In Ontario, the mottled duskywing is found in the same habitat as its food plant Ceanothus spp.: open or partially open, dry, sandy areas, or limestone alvars. These habitats are relatively uncommon and include dry open pine and pine oak woodland, other open dry woodlands, alvars, savannah and other dry open sandy habitats. Usually seen nectaring on wildflowers, or on wet sandy roads in the company of other duskywing species (Linton 2015).	Low	Low	There is limited dry open sandy habitats in the study areas. This species has not been observed in the vicinity of the study areas since 1950.
Bird	Bald eagle	*Haliaeetus leucocephalus*	SC	—	NAR	S2N,S4B	In Ontario, bald eagle nests are typically found near the shorelines of lakes or large rivers, often on forested islands. The large, conspicuous nests are typically found in large super-canopy trees along water bodies (Buehler 2000).	Low	Low	There are no super-canopy shoreline trees in any of the study areas. No nests were observed during field investigations.
Bird	Bank swallow	*Riparia*	THR	THR	THR	S4B	In Ontario, bank swallow breeds in a variety of natural and anthropogenic habitats, including lake bluffs, stream and riverbanks, sand and gravel pits, and roadcuts. Nests are generally built in a vertical or near-vertical bank. Breeding sites are typically located near open foraging sites such as rivers, lakes, grasslands, agricultural fields, wetlands and riparian woods. Forested areas are generally avoided (Garrison 1999).	Low	Low	There are no vertical banks in the study areas that would provide suitable nesting habitat for this species.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Bird	Barn swallow	*Hirundo rustica*	SC	THR	SC	S4B	In Ontario, barn swallow breeds in areas that contain a suitable nesting structure, open areas for foraging, and a body of water. This species nests in human made structures including barns, buildings, sheds, bridges, and culverts. Preferred foraging habitat includes grassy fields, pastures, agricultural cropland, lake and river shorelines, cleared right-of-way's, and wetlands (COSEWIC 2011). Mud nests are fastened to vertical walls or built on a ledge underneath an overhang. Suitable nests from previous years are reused (Brown and Brown 2019).	Low	Low	There are no structures that may provide suitable nesting habitat in any of the study areas.
Bird	Bobolink	*Dolichonyx oryzivorus*	THR	THR	SC	S4B	In Ontario, bobolink breeds in grasslands or graminoid dominated hayfields with tall vegetation (Gabhauer 2007). Bobolink prefers grassland habitat with a forb component and a moderate litter layer. They have low tolerance for presence of woody vegetation and are sensitive to frequent mowing within the breeding season. They are most abundant in established, but regularly maintained, hayfields, but also breed in lightly grazed pastures, old or fallow fields, cultural meadows and newly planted hayfields. Their nest is woven from grasses and forbs. It is built on the ground, in dense vegetation, usually under the cover of one or more forbs (Renfrew et al. 2015).	Low	Low	There is no suitable grassland or meadow habitat for this species on the sites or within the study areas.
Bird	Chimney swift	*Chaetura pelagica*	THR	THR	THR	S4B, S4N	In Ontario, chimney swift breeding habitat is varied and includes urban, suburban, rural and wooded sites. They are most commonly associated with towns and cities with large concentrations of chimneys. Preferred nesting sites are dark, sheltered spots with a vertical surface to which the bird can grip. Unused chimneys are the primary nesting and roosting structure, but other anthropogenic structures and large diameter cavity trees are also used (COSEWIC 2007).	Low	Moderate (Elmwood) (Hiawatha) (Rosemere) (West Shaft) (East Shaft)	There are no structures or large cavity trees that may provide suitable nesting habitat on the sites. Off-site, chimneys in residential areas in all study areas may provide suitable nesting and roosting habitat.
Bird	Common nighthawk	*Chordeiles minor*	SC	THR	SC	S4B	In Ontario, these aerial foragers require areas with large open habitat. This includes farmland, open woodlands, clearcuts, burns, rock outcrops, alvars, bogs, fens, prairies, gravel pits and gravel rooftops in cities (Sandilands 2007)	Low	Low	There are limited large areas of open habitat preferred by this species in the study areas.
Bird	Eastern meadowlark	*Sturnella magna*	THR	THR	THR	S4B	In Ontario, eastern meadowlark breeds in pastures, hayfields, meadows and old fields. Eastern meadowlark prefers moderately tall grasslands with abundant litter cover, high grass proportion, and a forb component (Hull 2019). They prefer well drained sites or slopes, and sites with different cover layers (Roseberry and Klimstra 1970).	Low	Low	There is no suitable grassland or meadow habitat for this species on the sites or within the study areas.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Bird	Eastern wood-pewee	*Contopus virens*	SC	SC	SC	S4B	In Ontario, eastern wood-pewee inhabits a wide variety of wooded upland and lowland habitats, including deciduous, coniferous, or mixed forests. It occurs most frequently in forests with some degree of openness. Intermediate-aged forests with a relatively sparse midstory are preferred. In younger forests with a relatively dense midstory, it tends to inhabit the edges. Also occurs in anthropogenic habitats providing an open forested aspect such as parks and suburban neighborhoods. Nest is constructed atop a horizontal branch, 1-2 m above the ground, in a wide variety of deciduous and coniferous trees (COSEWIC 2012).	Moderate (Rosemere)	Moderate (Rosemere)	The deciduous forest overlapping the Rosemere site and study area may provide suitable nesting habitat for this species.
Bird	Henslow's sparrow	*Ammodramus henslowii*	END	END	END	SHB	In Ontario, Henslow's sparrow breeds in large grasslands with low disturbance, such as lightly grazed and ungrazed pastures, fallow hayfields, grassy swales in open farmland, and wet meadows. Preferred habitat contains tall, dense grass cover, typically over 30 cm high, with a high percentage of ground cover, and a thick mat of dead plant material. Henslow's sparrow generally avoids areas with emergent woody shrubs or trees, and fence lines. Areas of standing water or ephemerally wet patches appear to be important. This species breeds more frequently in patches of habitat greater than 30 ha and preferably greater than 100 ha (COSEWIC 2011).	Low	Low	There is no undisturbed grassland or meadow habitat preferred by this species on the sites or in the study areas.
Bird	Peregrine falcon (anatum/tundrius subspecies)	*Falco peregrinus anatum/tundrius*	SC	SC	Not at Risk	S3B	In Ontario, peregrine falcon breeds in areas containing suitable nesting locations and sufficient prey resources. Such habitat includes both natural locations containing cliff faces (heights of 50 - 200 m preferred) and anthropogenic landscapes including urban centres containing tall buildings, open pit mines and quarries, and road cuts. Peregrine falcons nest on cliff ledges and crevices and building ledges. Nests consist of a simple scrape in the substrate (COSEWIC 2017).	Low	Low	There are no tall buildings that may provide suitable nesting habitat for this species on the sites or within the study areas.
Bird	Red-headed woodpecker	*Melanerpes erythrocephalus*	END	THR	END	S4	In Ontario, red-headed woodpecker breeds in open, deciduous woodlands or woodland edges and are often found in parks, cemeteries, golf courses, orchards and savannahs (Woodliffe 2007). They may also breed in forest clearings or open agricultural areas provided that large trees are available for nesting. They prefer forests with little or no understory vegetation. They are often associated with beech or oak forests, beaver ponds and swamp forests where snags are numerous. Nests are excavated in the trunks of large dead trees (Frei et al. 2017).	Moderate (Elmwood) (Hiawatha) (Rosemere)	Moderate (Rosemere) (East Shaft) (Hiawatha)	Large oak trees observed throughout the Elmwood and Hiawatha sites may provide suitable nesting habitat. The deciduous forest overlapping the Rosemere site and study area, and the deciduous forest immediately south of the east shaft site, may provide suitable nesting habitat for this species.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Bird	Wood thrush	*Hylocichla mustelina*	SC	THR	THR	S4B	In Ontario, wood thrush breeds in moist, deciduous hardwood or mixed stands that are often previously disturbed, with a dense deciduous undergrowth and with tall trees for singing perches. This species selects nesting sites with the following characteristics: lower elevations with trees less than 16 m in height, a closed canopy cover (>70%), a high variety of deciduous tree species, moderate subcanopy and shrub density, shade, fairly open forest floor, moist soil, and decaying leaf litter (COSEWIC 2012).	Moderate (Rosemere)	Moderate (Rosemere)	The deciduous forest overlapping the Rosemere site and study area may provide suitable nesting habitat for this species.
Fish	American eel	*Anguilla rostrata*	END	—	THR	S1?	In Ontario, American eel is native to the Lake Ontario, St. Lawrence River and Ottawa River watersheds. Their current distribution includes lakes Huron, Erie, and Superior and their tributaries. The Ottawa River population is considered extirpated. The preferred habitat of the American eel is cool water of lakes and streams with muddy or silty substrates in water temperatures between 16 and 19°C. The American eel is a catadromous fish that lives in fresh water until sexual maturity then migrates to the Sargasso Sea to spawn (Burridge et al. 2010; Eakins 2016).	Low	Low	Kenollie Creek, and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat and is not included in the current species' distribution. Although two dead individuals were observed along the Lake Ontario shoreline on the Elmwood site, the area of the lake adjacent to the site as well as the Hiawatha site, does not have suitable conditions to provide habitat for this species.
Fish	Deepwater sculpin - Great Lakes / Western St. Lawrence population	*Myoxocephalus thompsoni*	—	SC	SC	S3?	In Ontario, deepwater sculpin are found in Lakes Huron, Ontario, and Superior, as well as in scattered inland lakes. This fish species prefers cold, deep water (usually between 60-150 m in lakes), with soft substrates. Spawning takes place year-round, but peaks in August and early September. Its lifespan is 7 years, with females maturing at 3 years and males at 2 years (DFO 2019).	Low	Low	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat. The area of Lake Ontario adjacent to the Elmwood and Hiawatha sites does not have suitable conditions to provide habitat for this species.
Fish	Greater redhorse	*Moxostoma valenciennesi*	—	—	—	S3	In Ontario, greater redhorse are fond in the Upper St. Lawrence River, Ottawa River and tributaries, Lake Champlain, tributaries of Lake Ontario, Lake Erie, Lake St. Clair and Lake Huron, north to the Spanish River (Scott 1983; Eakins 2019). Habitat preferences include moderate to swift flowing medium to large rivers with coarse substrates and riffles for spawning, that occurs in late spring early summer at temperatures around 13°C (Eakins 2019; Holm et al. 2010). Cool bottom waters of runs and pools are used as foraging habitats (Holm et al. 2010).	Moderate	Moderate	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area may provide suitable habitat for this species.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Fish	Lake sturgeon - Great Lakes / Upper St. Lawrence population	*Acipenser fulvescens*	END	—	THR	S2	In Ontario, lake sturgeon, a large prehistoric freshwater fish, is found in all the Great Lakes and in all drainages of the Great Lakes and of Hudson Bay. This species typically inhabits highly productive shoal areas of large lakes and rivers. They are bottom dwellers and prefer depths between 5-10 m and mud or gravel substrates. Small sturgeons are often found on gravelly shoals near the mouths of rivers. They spawn in depths of 0.5 to 4.5 m in areas of swift water or rapids. Where suitable spawning rivers are not available, such as in the lower Great Lakes, they are known to spawn in wave action over rocky ledges or around rocky islands (Golder 2011).	Low	Low	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat. The area of Lake Ontario adjacent to the Elmwood and Hiawatha sites does not have suitable conditions to provide habitat for this species.
Fish	Redside dace	*Clinostomus elongatus*	END	END	END	S2	In Ontario, redside dace, a small cool water species common in the USA but less so in Canada, is found in tributaries of western Lake Ontario, Lake Erie, Lake Huron and Lake Simcoe. They are found in pools and slow-moving areas of small headwater streams with clear to turbid water. Overhanging grasses, shrubs, and undercut banks, are an important part of their habitat, as are instream boulders and large woody debris. Preferred substrates are variable and include silt, sand, gravel and boulders. Spawning occurs in shallow riffle areas (Redside Dace Recovery Team 2010).	Low	Low	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat.
Fish	Shortnose cisco	*Coregonus reighardi*	END	END	END	SH	In Ontario, shortnose cisco species was last reported in Georgian Bay in 1985 and Lake Ontario in 1964. It prefers clear, deep waters and water temperatures between 2 and 10°C (COSEWIC 2005).	Low	Low	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat. The area of Lake Ontario adjacent to the Elmwood and Hiawatha sites does not have suitable conditions to provide habitat for this species.
Fish	Upper Great Lakes kiyi	*Coregonus kiyi*	SC	SC	SC	S3	In Ontario, kiyi occurs in Lake Superior. The kiyi was last seen in Lake Ontario in 1964 and Lake Huron in 1973. The Kiyi is a cold-water species that prefers temperatures between 3.7 and 4.6°C and depths ranging from 35 to 200 m; however, it is rarely found in waters less than 108 m deep. Kiyi have been collected over lake bottoms of clay and mud substrates. Spawning generally occurs in the late fall at depths greater than 100 m (COSEWIC 2005).	Low	Low	Kenollie Creek and Mary Fix Creek overlapping the Rosemere site and study area are small warmwater creeks that are unlikely to provide suitable habitat. The Credit River in the west shaft study area is also unlikely to provide suitable habitat. The area of Lake Ontario adjacent to the Elmwood and Hiawatha sites does not have suitable conditions to provide habitat for this species.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Mammal	Eastern small-footed myotis	*Myotis leibii*	END	—	—	S2S3	In Ontario, eastern small-footed myotis is not known to roost in trees, but there is very little known about its roosting habits. The species generally roosts on the ground under rocks, in rock crevices, talus slopes and rock piles, but it occasionally inhabits buildings. Entrances of caves or abandoned mines where humidity is low, and temperatures are cool and sometimes subfreezing may be used as hibernacula (Humphrey 2017).	Low	Low	It is unlikely the riprap along the lake provides suitable maternity roosting habitat and no features suitable for hibernacula are present.
Mammal	Little brown myotis	*Myotis lucifugus*	END	END	END	S3	In Ontario, this species' range is extensive and covers much of the province. It will roost in both natural and man-made structures. Roosting colonies require a number of large dead trees, in specific stages of decay and that project above the canopy in relatively open areas. May form nursery colonies in the attics of buildings within 1 km of water. Caves or abandoned mines may be used as hibernacula, but high humidity and stable above freezing temperatures are required (ECCC 2018).	Low	Low	Suitable forested habitat with ELC codes associated with bat habitat (e.g., FOD, FOM, SWD, SWM) are not present (or very limited at the east shaft location) within the sites or study areas. Additionally, given the urban nature of the Project, any forest remnants or mature trees are unlikely to provide habitat for this species.
Mammal	Northern myotis	*Myotis septentrionalis*	END	END	END	S3	In Ontario, this species' range is extensive and covers much of the province. It will usually roost in hollows, crevices, and under loose bark of mature trees. Roosts may be established in the main trunk or a large branch of either living or dead trees. Caves or abandoned mines may be used as hibernacula, but high humidity and stable above freezing temperatures are required (ECCC 2018).	Low	Low	Suitable forested habitat with ELC codes associated with bat habitat (e.g., FOD, FOM, SWD, SWM) are not present (or very limited at the east shaft location) within the sites or study areas. Additionally, given the urban nature of the Project, any forest remnants or mature trees are unlikely to provide habitat for this species.
Mammal	Tri-colored bat	*Perimyotis subflavus*	END	END	END	S3?	In Ontario, tri-colored bat may roost in foliage, in clumps of old leaves, hanging moss or squirrel nests. They are occasionally found in buildings although there are no records of this in Canada. They typically feed over aquatic areas with an affinity to large-bodied water and will likely roost in close proximity to these. Hibernation sites are found deep within caves or mines in areas of relatively warm temperatures. These bats have strong roost fidelity to their winter hibernation sites and may choose the exact same spot in a cave or mine from year to year (ECCC 2018).	Low	Low	Suitable forested habitat with ELC codes associated with bat habitat (e.g., FOD, FOM, SWD, SWM) are not present (or very limited at the east shaft location) within the sites or study areas. Additionally, given the urban nature of the Project, any forest remnants or mature trees are unlikely to provide habitat for this species.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Reptile	Blanding's turtle - Great Lakes / St. Lawrence population	*Emydoidea blandingii*	THR	END	END	S3	In Ontario, Blanding's turtle will use a range of aquatic habitats, but favor those with shallow, standing or slow-moving water, rich nutrient levels, organic substrates and abundant aquatic vegetation. They will use rivers but prefer slow-moving currents and are likely only transients in this type of habitat. This species is known to travel great distances over land in the spring in order to reach nesting sites, which can include dry conifer or mixed forests, partially vegetated fields, and roadsides. Suitable nesting substrates include organic soils, sands, gravel and cobble. They hibernate underwater and infrequently under debris close to water bodies (COSEWIC 2016).	Low	Low	There are no wetlands on the sites or within the study areas.
Reptile	Milksnake	*Lampropeltis triangulum*	NAR	SC	SC	S4	In Ontario, milksnake uses a wide range of habitats including prairies, pastures, hayfields, wetlands and various forest types, and is well-known in rural areas where it frequents older buildings. Proximity to water and cover enhances habitat suitability. Hibernation takes place in mammal burrows, hollow logs, gravel or soil banks, and old foundations (COSEWIC 2014).	Low	Low	It is unlikely the limited forested habitat in the study areas is suitable for this species.
Reptile	Northern map turtle	*Graptemys geographica*	SC	SC	SC	S3	In Ontario, northern map turtle prefers large waterbodies with slow-moving currents, soft substrates, and abundant aquatic vegetation. Ideal stretches of shoreline contain suitable basking sites, such as rocks and logs. Along Lakes Erie and Ontario, this species occurs in marsh habitat and undeveloped shorelines. It is also found in small to large rivers with slow to moderate flow. Hibernation takes place in soft substrates under deep water (COSEWIC 2012).	Low	Low	The shorelines of Lake Ontario and the Credit River are likely too developed to provide suitable habitat.
Reptile	Snapping turtle	*Chelydra serpentina*	SC	SC	SC	S3	In Ontario, snapping turtle uses a wide range of waterbodies, but shows preference for areas with shallow, slow-moving water, soft substrates and dense aquatic vegetation. Hibernation takes place in soft substrates under water. Nesting sites consist of sand or gravel banks along waterways or roadways (COSEWIC 2008).	Low	Low	The shorelines of Lake Ontario and the Credit River are likely too developed to provide suitable habitat. Kenollie Creek and Mary Fix Creek have concrete bed and banks and are unlikely to provide suitable habitat conditions.
Reptile	Stinkpot or Eastern musk turtle	*Sternotherus odoratus*	SC	SC	SC	S3	In Ontario, eastern musk turtle is very rarely out of water and prefers permanent bodies of water that are shallow and clear, with little or no current and soft substrates with abundant organic materials. Abundant floating and submerged vegetation is preferred. Hibernation occurs in soft substrates under water. Eggs are sometimes laid on open ground, or in shallow nests in decaying vegetation, shallow gravel or rock crevices (COSEWIC 2012).	Low	Low	The shorelines of Lake Ontario and the Credit River are likely too developed to provide suitable habitat.
Vascular Plant	American ginseng	*Panax quinquefolius*	END	END	END	S2	In Ontario, American ginseng is found in moist, undisturbed and relatively mature deciduous woods often dominated by sugar maple. It is commonly found on well-drained, south-facing slopes. American ginseng grows under closed canopies in well-drained soils of glacier origin that have a neutral pH (ECCC 2018).	Low	Low	There is no undisturbed forest habitat in any of the study areas.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Vascular Plant	American hart's-tongue fern	*Asplenium scolopendrium*	SC	SC	SC	S3	In Ontario, American hart's-tongue fern grows on thin calcareous soils on or near dolomitic limestone of the Niagara Escarpment, and occasionally on open talus/scree slopes. Most populations are found on steep, moderately moist slopes that face north to northeast and are under a hardwood canopy cover (Environment Canada 2013).	Low	Low	The study areas do not contain thin soils preferred by this species.
Vascular Plant	Butternut	*Juglans cinerea*	END	END	END	S2?	In Ontario, butternut is found along stream banks, on wooded valley slopes, and in deciduous and mixed forests. It is commonly associated with beech, maple, oak and hickory (Voss and Reznicek 2012). Butternut prefers moist, fertile, well-drained soils, but can also be found in rocky limestone soils. This species is shade intolerant (Farrar 1995).	High (Elmwood)	High (Rosemere)	The small woodland patch in the northern portion of the Elmwood site could provide the suitable growing conditions for butternut. No individuals were observed during the site reconnaissance, but a detailed botanical inventory was not conducted due to access restrictions. Off-site portions of the deciduous forest overlapping the Rosemere site and study area may provide suitable growing conditions for this species. No butternuts were observed in the on-site portion of the deciduous forest.
Vascular Plant	Cleland's evening-primrose	*Oenothera clelandii*	—	—	—	S1	In Ontario, Cleland's evening-primrose grows in prairie habitat and on dry, open ground (Oldham and Brinker 2009).	Low	Low	There is no prairie habitat on the sites or in the study areas.
Vascular Plant	Clinton's clubrush	*Trichophorum clintonii*	—	—	—	S2S3	In Ontario, Clinton's clubrush grows in prairies, open woods, and rocky crevices along rivers (Oldham and Brinker 2009).	Low	Low	This species may be present along the shorelines of Lake Ontario, though the anthropogenically armoured shorelines are likely too disturbed.
Vascular Plant	Dense blazing star	*Liatris spicata*	THR	THR	THR	S2	In Ontario, dense blazing star is found mainly in moist tall-grass prairies, oak savannahs, wet meadows and along roadsides in full sun in open areas (COSEWIC 2010). It grows in moist to wet, sandy calcareous soils (WDNR 2019). It is primarily restricted to southwestern Ontario.	Low	Low	This species is not likely to be present in the disturbed, anthropogenically developed landscape in the study areas.
Vascular Plant	Hill's pondweed	*Potamogeton hillii*	SC	SC	SC	S2S3	In Ontario, Hill's pondweed grows in the muddy substrates of cold, clear, slow-moving, calcareous streams, ditches, and ponds. It is found in water up to 1 m in depth. Often found near flow obstructions including the upstream side of road culverts, among stumps and fallen trees, or in shallow water among rushes and sedges (Parks Canada Agency 2014).	Low	Low	There are no coldwater streams or ponds on the sites or in the study areas.
Vascular Plant	Kentucky coffee-tree	*Gymnocladus dioicus*	THR	THR	THR	S2	In Ontario, Kentucky coffee-tree is found in rich, mesic and floodplain forests. Populations are scattered throughout the Carolinian forest in Ontario, but are commonly found near streams, rivers, former swamps and wetlands. Kentucky coffee-tree thrives in disturbed areas, but can survive in most habitats, even difficult ones (e.g., bare or poor soils) as long as sunlight is present (Environment Canada 2014). This species prefers deep, rich soils.	High (Elmwood)	Low	Planted Kentucky coffee-trees were observed in the centre of the Elmwood site (i.e., within the park). Planted specimens are not protected under the ESA.

Taxon	Common Name	Scientific Name	Endangered Species Act[1]	Species at Risk Act (Sch 1)[2]	COSEWIC[3]	Provincial (SRank)[4]	Habitat Requirements	Potential to Occur on the Site	Potential to Occur Off-Site, Within the Study Area	Rationale for Potential to Occur in the Study Area
Vascular Plant	Schreber's wood aster	*Eurybia schreberi*	—	—	—	S2	Schreber's wood aster grows in woodland habitat.	Low	Low	There is limited woodland habitat in the study areas preferred by this species.
Vascular Plant	Smooth yellow false foxglove	*Aureolaria flava*	—	—	THR	S2?	Smooth yellow false foxglove is generally found in dry, open upland oak savannas and woodlands (Arkansas Native Plant Society 2019; Canada 2019).	Low	Low	There is limited dry woodland habitat on the sites or in the study areas preferred by this species.

Notes:

1 Endangered Species Act (ESA), 2007 (Current to 8 Sep 2023). Species at Risk in Ontario List, 2007 (O.Reg 230/08; current to 8 Sep 2023); Schedule 1 (Extirpated - EXP), Schedule 2 (Endangered - END), Schedule 3 (Threatened - THR), Schedule 4 (Special Concern - SC)

2 Species at Risk Act (SARA), 2002. Schedule 1 (Current to 8 Aug 2023); Part 1 (Extirpated), Part 2 (Endangered), Part 3 (Threatened), Part 4 (Special Concern)

3 Committee on the Status of Endangered Wildlife in Canada (COSEWIC) http://www.cosewic.gc.ca/

4 Provincial Ranks (SRANK) are Rarity Ranks assigned to a species or ecological communities, by the Natural Heritage Information Centre (NHIC). These ranks are not legal designations. SRANKS are evaluated by NHIC on a continual basis and updated lists produced annually. 1.0 INTRODUCTION

WSP Canada Inc. (WSP) has been retained by GM BluePlan Engineering Limited (GMBP) on behalf of the Region of Peel (the Region) to conduct a geotechnical desktop study as part of the Schedule 'C' Municipal Class Environmental Assessment for the Port Credit East Water and Wastewater Servicing Optimization Strategy (the Project) in the City of Mississauga, Region of Peel, Ontario. The purpose of the Project is to investigate alternative water and wastewater strategies for the Rosemere, Hiawatha, and Elmwood sewage pumping station (SPS) servicing areas, investigate alternative routes for the future/new Lakeshore Sub-transmission watermain east of the Credit River, and to develop an integrated servicing strategy that supports existing servicing needs and projected growth.

The purpose of this report is to present the results of the geotechnical desktop study. This report was prepared for the exclusive use by GMBP, the Region, and their design team and is intended to be used for planning and preliminary design purposes only. Any use that a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of the third party. The report is based solely on the review of historical and publicly available information and data obtained by WSP as described in this report. Additional site-specific explorations of the subsurface conditions must be carried out prior to any further design activities.

The scope of work for this assignment, as outlined in our proposal (CX19129019) dated September 11, 2019, for this project, includes review of available information to summarize the existing subsurface soil and groundwater conditions and identify areas where additional geotechnical investigation and information is required to support the design.

The factual data, interpretations, and recommendations contained in this report pertain to a specific project as described in the report and are not applicable to any other project or site location. In addition, this report should be read in conjunction with the "Important Information and Limitations of This Report" contained in Appendix A of this report. The reader's attention is specifically drawn to this information, as it is essential for the proper use and interpretation of this report.

2.0 SITE AND PROJECT DESCRIPTION

The Study Area is shown on Figure 1 and is generally limited by the Credit River in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Seneca Drive in the north, and Lake Ontario in the east in the City of Mississauga.

It is understood the following conceptual design is being considered as part of the Preliminary Preferred Strategy:

1) New Lakeshore Road Trunk Sewer – trenchless installation from a compound at Marina Park from the west to a compound to the west at the municipal parking lot at Elmwood Avenue North and Lakeshore Road East;

2) New Lakeshore Road Sub-Transmission Watermain – trenchless installation from a separate compound at Marina Park from the west to a compound to the west at the municipal parking lot at Elmwood Avenue North and Lakeshore Road East;

3) Rosemere Sewage Pumping Station (SPS) – replacing the existing SPS at Rosemere Road and associated twin forcemains East to Vesta Drive; and

4) Elmwood and Hiawatha Sewage Pumping Stations – Decommission both SPSs located in Tall Oaks Park and Hiawatha Park, respectively, and connect to Lakeshore Road Trunk Sewer. Connection will be made via a proposed gravity sewer along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South.

Both the Lakeshore Road Trunk Sewer and Sub-Transmission Watermains require crossing of the Credit River.

3.0 AVAILABLE INFORMATION

This geotechnical desktop study is based on available subsurface information obtained from the following sources:

- Golder Associates Ltd. hard copy and digital libraries;
- Region of Peel records;
- Ministry of Transportation Foundation Library service (i.e., Geocres database);
- Oak Ridge Moraine Groundwater Program database (i.e., YPDT – CAMC database);
- Water Well Information System (WWIS), Ontario Ministry of Environment, Conservation and Parks (MECP), Queens Printer 2019; and
- Chapman, L.J., and Putnam, D.F., 2007, *"The Physiography of Southern Ontario"*; Ontario Geological Survey.

3.1 Previous Geotechnical Field Investigations

The anticipated soil, bedrock, and groundwater conditions described below are in part based off geotechnical data obtained from previous field investigations carried out within the Study Area, see Table 1 below. The relevant records of the boreholes, drillholes and/or in-situ testing from these investigations are provided in Appendix B and on the Existing Borehole Location Plan on Figure 4. Although the northings and eastings of the previous investigation boreholes were generally surveyed, it should be noted that the points are referenced to differing spatial reference systems, and as such, the borehole locations shown on Figure 4 should be considered approximate.

Table 1: Available Information

Note(s):

1. Boreholes 13-PC1, 13-PC2 and 13-PC3 were advanced as part of the 2015 investigation noted. The other boreholes included in this report are sourced from various Geocres reports detailing field investigations from 1959, 1960, and 1960 (i.e., MTO GEOCRES No. 30M11-150, 30M11-153, 30M11-155 and 30M11-156).
2. Only the Record of Borehole & Drillhole sheets from this project have been published. Reporting for this project has not yet been completed.

In reviewing the available historical reports, WSP has relied in good faith on information obtained by others as referenced above. We assume the information is factual and accurate and accept no responsibility for any deficiency, misstatements or inaccuracies contained in this report as a result of omissions, misinterpretations or fraudulent acts of others.

The available information from previous geotechnical field investigations is concentrated at the following locations within the Study Area:

- Lakeshore Road bridge over the Credit River;
- Lakeshore Road between the Credit River and Woodlawn Avenue;
- Port Credit Arena (40 Stavebank Road); and
- Canadian Pacific Railway bridge over Hurontario Street & Port Credit GO Station.

Most of the existing borehole information is along Lakeshore Road and closest to the proposed locations of Items 1 and 2 of the Preliminary Preferred Strategy (i.e., the new Lakeshore Road Trunk Sewer and new Lakeshore Road Sub-Transmission Watermain). The existing borehole information at the Port Credit Arena and at the Canadian Pacific Railway bridge over Hurontario Street is located closest to Item 3 and is greater than 100 m away from the new SPS at Rosemere Road and twin forcemains. No previous geotechnical field investigations were reviewed in the vicinity of Item 4, the Elmwood and Hiawatha Sewage Pumping Stations and associated connections along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South to Lakeshore Road Trunk Sewer.

3.2 Water Well Records

In addition, the locations of the water well records from the Water Well Information System (WWIS), Ontario Ministry of Environment, Conservation and Parks (MECP) are shown on Figure 4. Water well records were reviewed in the vicinity of the following proposed infrastructure where there is limited geotechnical information available from previous investigations:

- Rosemere Sewage Pumping Station (SPS) and twin forcemains east to Vesta Drive; and
- Elmwood and Hiawatha Sewage Pumping Stations at Tall Oaks Park and Hiawatha Park, respectively, proposed gravity sewer connections along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South.

Eight water well records were located between the Rosemere SPS and Vesta Drive, and only two water well records were available at the Elmwood and Hiawatha SPSs. No water well records were recorded along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South.

In reviewing the available water well records, WSP has relied in good faith on information obtained by others. We assume the information is factual and accurate and accept no responsibility for any deficiency, misstatements, or inaccuracies contained in this report as a result of omissions, misinterpretations, or fraudulent acts of others. It should be noted that water well records include limited geotechnical data and are not reviewed by a geotechnical engineer. Geotechnical laboratory testing and standard penetration testing (SPT) are not recorded on water well records and as such, the subsurface conditions described by well technicians is not supported by this data. Water well records should not be relied upon for preliminary or detail design of the proposed infrastructure and additional geotechnical investigation should be carried out within the Study Area (see Section 6.0).

4.0 SITE GEOLOGY AND SUBSURFACE CONDITIONS

4.1 Regional Geology

The project area is located within the Iroquois Plain Physiographic Region, as delineated in The Physiography of Southern Ontario[1] (Chapman and Putman 2007). The glacial Iroquois plain stretches along the northern shoreline of Lake Ontario, extending from the Niagara Escarpment in the west to the Scarborough Bluffs in the east. The Iroquois Plain soils consist of glaciolacustrine sediments deposited in former Lake Iroquois, primarily sands, silts and gravels, with a shallow cover of till remaining over the shale bedrock.

The Surface Geology maps shown on Figure 2 indicate that the surficial soil at the site is composed of a coarse textured glaciolacustrine deposit consisting of sands, gravel, minor silt and clay (9C - Foreshore and Baseline Deposit). The map indicates that modern alluvial deposits (19 - Modern Alluvial Deposit) is located along the

[1] Chapman, L.J. and Putnam, D.F. 2007. *Physiography of southern Ontario*; Ontario Geological Survey, Miscellaneous Release--Data 228.

watercourses and associated tributaries. A Till deposit (8B – Interbedded Flow Till, Rainout Deposits and Silt and Clay) is located towards the east end of the Project area. Figure 3 shows the groundwater level contours in the Study Area.

It is understood that a natural marsh at the mouth of the Credit River has been filled over time. Based on previous reporting by Golder in 1991, it is understood that part of the infilled area at the river mouth was historically used as a garbage dump. An air photo from August 1939 showing the original shoreline of the Credit River is shown in Figure 5, and aerial photos of the Study Area from 1954 and 2020 are shown in Figures 6 and 7.

The Georgian Bay Formation that underlies the overburden within the Study Area consists mainly of grey shale, containing siltstone, sandstone and limestone interbeds. Outcrops of the formation are commonly found along water courses on the west side of Toronto and in Mississauga, notably the Humber River, Mimico Creek, Etobicoke Creek, and Credit River Valleys.

4.2 Anticipated Soil, Bedrock, and Groundwater Conditions

In general, the soil conditions at the site are anticipated to consist of varying amounts of fill materials, silt to sand to gravel deposits, underlain and interlayered by silty clay-clayey silt to silty clay deposits, underlain by glacial till deposits, and further underlain by residual soil. The glacial till deposits are generally anticipated to be comprised of gravelly, silty sand and/or sandy, gravelly silty clay containing cobbles and boulders. Near the Credit River, the till deposits thin and organic silt and/or peat deposits are anticipated, along with thicker deposits of silt to sand to gravel.

The overburden is underlain by shale bedrock of the Georgian Bay Formation. In the previous investigations reviewed, the bedrock surface was encountered between 4.2 m and 17.2 m below ground surface (Elevation 60.5 m and 75.6 m) along Lakeshore Road (i.e., near the location of the proposed Lakeshore Road Trunk Sewer and Sub-Transmission Watermain) and between 5.5 m and 10.7 m below ground surface (Elevation 73.9 m and 78.9 m) north of Lakeshore Road near the Canadian Pacific Railway (i.e., near the location of the proposed Rosemere SPS and associated works).

No existing geotechnical field investigations were reviewed near the Elmwood and Hiawatha SPSs, nor near the associated proposed gravity sewer connection along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South. In general, there is limited information available regarding the subsurface conditions south of Lakeshore Road East within the Study Area. A review of water well records in the Study Area shows that only two well records are available in the Study Area near Item 4 of the Preliminary Preferred Strategy. An approximately 9.1 m deep well at Hiawatha Park near the existing SPS (Well Tag No. A202716) installed in 2017 and an approximately 3 m deep well on Carlis Place near Tall Oaks park and the existing Elmwood SPS (Well Tag No. A315035) installed in 2021. No water well records are shown along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South within the area relevant to Item 4.

4.2.1 Lakeshore Road from Front Street to Stavebank Road (Credit River)

As summarized in Table 2, previous geotechnical investigations at the Lakeshore Road from Front Street to Stavebank Road, generally for the bridge over the Credit River, were carried out by McCormick & Rankin Ltd in 1967 and Golder in 1986, 2019, and 2022. Based on the subsurface conditions encountered in boreholes advanced for the previous investigations, the overburden consists generally of non-cohesive fill layers, underlain by a silt to sand to silty gravel deposit, underlain by an organic silt deposit with peat layers, underlain by a silty clay to silty clay-clayey silt deposit that contains organics in some areas, underlain by a silt to sand to gravel

deposit and further underlain by cohesive till deposit in some areas. In some areas, wood fragments and other organic material were encountered in the lower silt to sand deposit and a residual soil deposit was encountered overlying the shale bedrock.

The overburden is underlain by shale bedrock of the Georgian Bay Formation. Bedrock coring was carried out in the McCormick & Rankin Ltd, 1967, and both the Golder, 2019 and Golder, 2022 investigations for lengths ranging between 3.7 m and 26.7 m. The bedrock surface was encountered between 5.5 m and 17.2 m below ground surface (Elevation 60.5 m and 71.9 m). The cored bedrock is described as highly weathered to fresh, thinly laminated to medium bedded, dark grey to grey, fine grained, non to faintly porous, weak to medium strong shale with medium strong to strong interbeds of limestone and siltstone of the Georgian Bay Formation. The Unconfined Compressive Strength (UCS) of the shale bedrock was measured in the Golder, 2019 and Golder, 2022 investigations and ranges from 12.4 MPa to 20.6 MPa.

The boreholes were generally advanced from the river's banks; however, three cone penetration tests (CPT) were carried out in the McCormick & Rankin Limited, 1967 investigation through the river bed south of the existing bridge location at that time. The CPT were pushed from the river bed to refusal between 5.8 m and 7.3 m below the river bed. The tip resistance measured is generally less than 2.4 kPa until the test reaches refusal.

Table 2: Summary of Subsurface Conditions at Lakeshore Road and Credit River

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
McCormick & Rankin Limited, 1967	1 and 2 (and CPT 3, 4, 5, 6 and 7)	Boreholes advanced to 13.4 m and refusal at 17.1 m CPT advanced to refusal between 11.6 m to 12.8 m	Non-cohesive fill Organic silt Sand and gravel	13 m below ground surface (cored)
Golder, 1986-1	1 and 2	Boreholes advanced to auger refusal on inferred bedrock at 15.9 m and 16.0 m	Non-cohesive fill Silty sand to sandy silt Organic silt Silty sand to sand Cohesive Till	Elev. 62.7 m and 62.6 m (inferred, no core)
Golder, 1986-2	101, 102	Boreholes advanced to 9.6 m and 10.4 m	Non-cohesive fill Silty sand to sand Organic silt Sand	N/A
Golder, 1991-1	1 and 11	Boreholes advanced to 8.1 m and 9.6 m	Non-cohesive fill Sand Silt to Sand, contains organics Fibrous peat Cohesive till	N/A
Golder, 2019	BH1, BH1-2, BH1-3 and BH35	Boreholes advanced to between 6.7 m and 13.6 m Rock coring carried out in BH1 and BH35	Cohesive / Non-cohesive fill Silt and Sand, contains organics Silty clay, contains organics Cohesive till	Elev. 70.2 m and 71.9 m (cored)

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
Golder, 2022	BH21-45 to BH21-52, BH21-60 and BH21-62	Boreholes advanced to between 30.3 m and 34.1 m Rock coring carried out in all boreholes	Non-cohesive fill Silty Sand to Silty Gravel Silt to Organic Silt Silty clay-clayey silt to Silty Clay, contains organics Silty Sand to Gravel Residual Soil	Elev. 60.5 m to 70.5 m (cored)

Note(s):

1. Northings, eastings and ground surface elevations of the previous investigation boreholes were generally surveyed and referenced to a local benchmark. However, it should be noted that the elevations are referenced to differing geodetic datums and as such, the bedrock surface elevations summarized above should be considered approximate.

4.2.2 Lakeshore Road from Stavebank Road to Woodlawn Avenue

As summarized in Table 3, previous geotechnical investigations along Lakeshore Road from Stavebank Road to Woodlawn Avenue were carried out by Golder in 1991 and 2022. Based on the subsurface conditions encountered in boreholes advanced for the previous investigations, the overburden generally consists of non-cohesive and cohesive fill layers, underlain by interlayered silty clay and silt to sand deposits, and further underlain by a cohesive till grading to non-cohesive till with depth. In some areas, a residual soil deposit was encountered overlying the shale bedrock.

The overburden is underlain by shale bedrock of the Georgian Bay Formation. Bedrock coring was carried out in both the Golder, 1991 (2) and Golder, 2022 investigations for lengths ranging between 1.2 m and 28.6 m. The bedrock surface was encountered between 4.2 m and 13.9 m below ground surface (Elevation 66.2 m and 75.6 m). The cored bedrock is described as completely weathered to fresh, thinly bedded, grey, fine grained, faintly porous, weak shale with medium strong to strong interbeds of limestone and siltstone of the Georgian Bay Formation. The Unconfined Compressive Strength (UCS) of the shale bedrock was measured in the Golder, 2019 and Golder, 2022 investigations and ranges from 17.3 to 26.6 MPa and on the limestone / siltstone layers is 169.2 MPa.

Table 3: Summary of Subsurface Conditions at Lakeshore Road from Credit River to Woodlawn Avenue

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
Golder, 1991-1	2 to 10	Boreholes advanced to between at 6.1 m and 9.6 m	Non-cohesive / Cohesive fill Silty Sand to Sand Silt to Clayey Silt Cohesive till Silty Clay Non-cohesive till	Elev. 72.0 m and 75.6 m (inferred, no core)
Golder, 1991-2	101 to 104	Boreholes advanced to between 6.0 m and 6.6 m	Cohesive till Silty Clay Non-cohesive till	Elev. 74.6 m to 75.0 m (inferred, no core)

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
Golder, 2022	BH21-53 to BH21-59, BH21-63 and BH21-64	Boreholes advanced to between 9.5 m and 36.2 m Rock coring carried out in all boreholes except BH21-63	Non-cohesive / Cohesive fill Silt to Sand to Gravel Silty Clay-Clayey Silt to Silty Clay Gravelly Silty Sand to Sand Cohesive till Residual Soil	Elev. 60.5 m to 75.7 m (cored)

Note(s):

1. Northings, eastings and ground surface elevations of the previous investigation boreholes were generally surveyed and referenced to a local benchmark. However, it should be noted that the elevations are referenced to differing geodetic datums and as such, the bedrock surface elevations summarized above should be considered approximate.

4.2.3 Rosemere Road to Vesta Drive

As summarized in Table 4, previous geotechnical investigations were carried out North of Lakeshore Road at the Port Credit Arena, Hurontario Street and CNR bridge and the Port Credit GO Station by Golder in 1984 and 2013, and 4Transit in 2017, respectively. Based on the subsurface conditions encountered in boreholes advanced for the previous investigations, the overburden consists of non-cohesive fill layers, underlain by a silt to sand deposit, underlain by a sandy silt to silty clay deposit, and further underlain by a cohesive till that contains cobbles, shale and limestone fragments. Limestone gravel, boulders and slabs were encountered the cohesive deposits above bedrock in the Golder, 2013 investigation.

The overburden is underlain by shale bedrock of the Georgian Bay Formation. Bedrock coring was carried out in the Golder, 2013 and 4Transit, 2018 investigations for lengths ranging between 0.6 m and 7.7 m. The bedrock surface was encountered between 5.5 m and 10.7 m below ground surface (Elevation 73.4 m and 78.9 m). The cored bedrock is described as hard, grey shale and limestone in the Golder, 2013 investigation and slightly weathered to fresh, thinly laminated to medium bedded, grey, very weak to medium strong shale, interbedded with slightly weathered to fresh, light grey, thinly laminated to thinly bedded, medium strong to very strong siltstone and limestone layers of the Georgian Bay Formation.

Table 4: Summary of Subsurface Conditions at Port Credit Arena and CPR / Hurontario Street

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
Golder, 1984	1 to 5	Boreholes advanced to between at 12 m and 26.5 m	Non-cohesive fill Silt to Silty Sand Cohesive till	N/A
Golder, 2013	13-PC1 to 13-PC3, 150-2 and 150-4, 153-10 and 153-11, 153-13 and 153-15, 155-3, 156-1 to 156-4	Boreholes advanced to between 2.1 m and 12.2 m	Non-cohesive fill Sand Sandy Silt to Silty Clay Cohesive till	Elev. 73.9 m to 78.9 m (cored) and Elev. 78.1 m (inferred, no core)

Report	Boreholes	Comments on Existing Information	Overburden	Bedrock Surface[1]
4Transit, 2018	PC-BH01 PC-BH03 PC-BH03-PQ PC-BH04	Boreholes advanced to between 5.2 m and 15.2 m.PC-BH03-PQ advanced through PQ sized soil coring. Rock coring carried out in Borehole PC-BH01 and PC-BH03.	Non-cohesive fill Silt Cohesive till, contains cobbles and shale & limestone fragments	Elev. 76.2 m and 73.4 m (cored)

Note(s):

1. Northings, eastings and ground surface elevations of the previous investigation boreholes were generally surveyed and referenced to a local benchmark. However, it should be noted that the elevations are referenced to differing geodetic datums and as such, the bedrock surface elevations summarized above should be considered approximate.

It should be noted that the previous investigations by Golder described above were carried out over 100 m away from the Rosemere SPS and proposed twin forcemains that extend to Vesta Drive. In addition to the previous investigations, one water well record was located on Rosemere Road. The stratigraphy in the water well record from Rosemere Road (Well I.D. 7287343) is described by the well technician as 1.1 m of brown sand fill, underlain by 2 m of soft, brown silty clay, further underlain by 3 m of dense, grey silty clay.

4.2.4 Hiawatha Parkway, Wanita Road, and Elmwood Avenue South

A review of water well records in the Study Area shows that only two well records are available in the Study Area near Item 4 of the Preliminary Preferred Strategy. An approximately 9.1 m deep well at Hiawatha Park near the existing SPS (Well Tag No. A202716) installed in 2017 and an approximately 3 m deep well on Carlis Place near Tall Oaks Park and the existing Elmwood SPS (Well Tag No. A315035) installed in 2021. No water well records are shown along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South within the area relevant to Item 4.

The stratigraphy in the Hiawatha Park well is described by the well technician as 1.5 m of brown sand (potentially fill), underlain by 3 m of grey silty clay containing gravel, further underlain by 4.6 m of dense, brown silt and sand grading to sand with depth. The stratigraphy in Carlis Place well is described by the well technician as 3 m of brown, loose till.

5.0 ANTICIPATED GEOTECHNICAL CHALLENGES AND MITIGATION MEASURES

The tables below outline the conceptual geotechnical challenges, potential impacts on construction, and suggested mitigation measures to minimize subsurface risks during construction of the Rosemere SPS and associated twinned forcemains, the Trunk Sewer and Sub-Transmission Watermain on Lakeshore Road, decommissioning of the existing Elmwood and Hiawatha SPS, and all associated gravity sewers. Table 5 summarizes the geotechnical challenges and mitigation measures associated with open-cut excavations which may be considered for utility installation and SPS construction. Table 6 summarizes the geotechnical challenges and mitigation measures associated with trenchless installations which we understand is being considered for the new Lakeshore Road Trunk Sewer and Sub-transmission Watermain.

Table 5: Geotechnical Challenges and Mitigation Measures – Open Cut Excavation

Geotechnical Challenge	Description	Mitigation Measures
Perched Groundwater in Fill Layers	Excavations will likely extend through fill layers that may contain perched groundwater.	Groundwater conditions should be monitored and controlled during trench excavation in all sections to protect the integrity of the trench base and maintain dry working conditions. A working concrete slab may also be considered in sensitive soils.
Water-Bearing Granular Zones / Groundwater Control	Excavations may extend below the groundwater level in the water-bearing granular soil zones (i.e., silt to sand to gravel) present within the overburden.	Design of open-cut excavations for pumping stations and trenched excavations should incorporate groundwater control to minimize the impact of dewatering on the watercourses, surrounding infrastructure and other sensitive features. SPS may need to be designed to resist hydrostatic uplift pressures (ex. anchoring, thickening of base slab).
Weak Cohesive Soils / Base Stability	Weak cohesive soils are considered unsuitable founding soils, and when present near the base of the excavation can lead to base heave. If a water-bearing permeable deposit is present below the relatively impermeable cohesive soils, basal uplift is a risk.	Proposed utility inverts and founding elevations for the SPSs should be reviewed once additional borehole information is collected along the alignments to determine the anticipated soil stratigraphy of the founding soils. Sub-excavation and replacement of founding soils, thickening of utility bedding, and/or design modification to may be considered.
Organic Deposits	Organic deposits encountered at the Credit River and along Lakeshore Road near the Credit River are considered unsuitable founding soils.	Sub-excavation and replacement of the organic deposits and thickening / reinforcing of the utility bedding beneath the utility inverts may be considered to reduce post-construction settlement.
Fine-grained Soils with Corrosion Potential	Some soils have the potential to corrode steel and concrete over time, especially fine-grained soils such as the silts and silty clays described in Section 4.2.	Analyse soil samples for parameters that contribute to corrosion potential (i.e., pH, soluble sulphate, chlorides, electrical conductivity and resistivity). Design utility installations according to corrosion potential.
Presence of Cobbles and Boulders in Glacial Till	It should be assumed that cobbles/boulders are present in the overburden and are comprised of a variety of different lithology's including native bedrock but also glacial erratics from the Canadian Shield with a wide range in strengths.	Excavating equipment with ground loosening tools such as a rock bucket, hoe ram and picks and chisels may be considered. Contract Documents should include provisions to manage the excavation and disposal of cobbles and boulders.
Shallow Bedrock	Open-cut excavations for pumping stations and utility trenches may extend into hard residual soil and / or weathered bedrock. The bedrock surface was encountered as high as Elevation 78.9 m (approximately 4 to 5 m below ground surface).	Use of hydraulic excavators equipped with rock teeth and supplemented with equipment such as road-headers or hydraulic rock breakers ("hoe-ram") may be considered.

Geotechnical Challenge	Description	Mitigation Measures
Credit River Crossing	If open cut excavation is considered for the proposed watermain, river flow will have to be temporarily disrupted.	Open cut excavation will require a cofferdam to divert the creek to construct the utility in conditions suitable to implement the work and to provide for required inspection of the founding soils before placing pipe bedding, etc. The design should be reviewed by the conservation authorities to ensure it doesn't pose risks to the river and surrounding natural environment.
	Soil cover thickness above the proposed watermain obverts will have to be reviewed to reduce the risk of erosion and scour.	The design of the proposed watermain should ensure that the utility will have adequate soil cover or erosion and scour protection.

Table 6: Geotechnical Challenges and Mitigation Measures – Trenchless Installation

Geotechnical Challenge	Description	Mitigation Measures
Water-Bearing Granular Zones/Groundwater Control	Trenchless installations will likely be proposed below the groundwater level, and may extend through the water-bearing granular soil zones (i.e., silt to sand to gravel) present within the overburden. Active dewatering may be required to control groundwater.	Detailed design of the compounds and tunnel should incorporate groundwater control methods to minimize the impact of dewatering on the watercourses, surrounding infrastructure and sensitive features (ex. circular secant pile wall).
Presence of Cobbles and Boulders	It should be assumed that cobbles/boulders are present in the overburden and are comprised of a variety of different lithology's including native bedrock but also glacial erratics from the Canadian Shield with a wide range in strengths.	The presence of cobbles and/or boulders should be considered in machine selection and adopted tunnelling method through overburden, if trenchless installation is considered. Contract Documents should include provisions to manage the excavation and disposal of cobbles and boulders.
Mixed-Face and Overburden Tunnelling	A trenchless installation may encounter overburden and mixed-face conditions as such hybrid / dual mode tunnel boring machine (rock TBM with slurry or EPB capability) should be considered.	Geotechnical Baseline Report to define the overburden/bedrock interface and alert the contractor about the risks associated with the mixed face conditions and tunnelling through soils.
In-situ Stresses and Swelling of Shale Bedrock	Shale bedrock may experience swelling when stresses are relieved due to excavation or tunnelling. The swelling and in situ stresses in the shale bedrock may impact the temporary and permanent tunnel and shaft liner design.	Tunnel Designers should consider in situ stresses and the potential for swelling in the liner design, if trenchless installation is considered.
Naturally occurring BTEX and Subsurface Gases	Naturally occurring benzene, toluene, ethylbenzene, and xylenes (collectively BTEX) and other naturally occurring subsurface gases (methane, hydrogen sulphide and carbon dioxide) have been encountered within shale bedrock and/or glacially derived till deposits. Subsurface gases can impact tunnel boring machine selection, ventilation design, tunnel spoil management and disposal options.	Tunnel spoil disposal options and worker health and safety requirements should be developed during the detailed design and incorporated into the Contract Documents.

Geotechnical Challenge	Description	Mitigation Measures
Credit River Crossing	Limited soil or bedrock cover above the tunnel obvert.	Trenchless installation may require additional intervention measures (such as pressurized face tunnel boring machine, grouting etc.) to increase the stability of the excavation and reduce the risk of frac-out at the Credit River. The additional intervention measures should be reviewed by the conservation authorities to ensure they do not pose risks to the Creek and the natural environment.

6.0 RECOMMENDATION FOR FURTHER WORK FOR PRELIMINARY DESIGN

Additional geotechnical investigation is recommended to further characterize the overburden, bedrock, and groundwater conditions at the locations of Items 3 and 4 of the Preliminary Preferred Strategy, and at the proposed compound in the municipal parking lot at the northeast corner of Lakeshore Road and Elmwood Drive. Limited existing geotechnical field investigations were reviewed in the vicinity of the Rosemere SPS and the associated twin forcemains extending east to Vesta Drive (i.e., Item 3). The two investigations by Golder in 1984 and 2013 that were reviewed and described in Section 4.2.3 are located greater than 100 m away. No existing geotechnical field investigations were reviewed that were located south of Lakeshore Road near the Elmwood and Hiawatha SPSs nor the associated proposed gravity sewer connections along Hiawatha Parkway, Wanita Road, and Elmwood Avenue South (i.e., Item 4). Boreholes were advanced near the eastern compound for Items 1 and 2 along Lakeshore Road as part of the Golder, 2022 investigation, however, they are located along Lakeshore Road and not at the site of the proposed compound (parking lot). Additional boreholes and in-situ testing, including but not limited to Pressuremeter testing, should be carried out within the parking lot to minimize subsurface risks during construction.

Additional geotechnical investigation should be designed to fill in subsurface information data gaps and to minimize risk of unforeseen ground conditions during construction. Future investigations can characterize the overburden, bedrock and groundwater conditions through the following methods:

- Advance boreholes and collection soil samples to identify the depth, composition and strength/stiffness of fill layers and native soils deposits;
- Provide soil parameters for trenchless and/or temporary excavation support design for the existing subsurface soils through in-situ testing (i.e., Standard Penetration Test (SPT), field shear vanes, pressuremeter testing, etc.), laboratory testing and geotechnical analysis;
- Delineate the bedrock surface and the thickness of completely to moderately weathered bedrock rock using SPT boreholes, PQ Soil Core boreholes, drillholes using the “triple-tube” bedrock coring method, and/or geophysical survey;
- Install monitoring wells (i.e., standpipe piezometers or vibrating wire piezometers) in boreholes and measure representative groundwater levels of all seasons through discontinuous, manual readings or using continuous data loggers;

- Identify potentially elevated groundwater levels or pressurized aquifers that may be associated with the Credit River and/or buried river valleys;
- In-situ testing of water-bearing soil zones to assess the need for groundwater control and support of excavation options (i.e., packer testing, rising / falling head testing); and
- Assess environmental quality of soil and groundwater for handling, re-use and disposal through analytical laboratory testing and environmental analysis.

7.0 CLOSURE

We trust that this desktop study report meets your current planning and conceptual design requirements. If you have any questions regarding the contents of this report, please do not hesitate to contact this office.

APPENDIX A

Important Information and Limitations of This Report

IMPORTANT INFORMATION AND LIMITATIONS OF THIS REPORT

Standard of Care: Golder Associates Ltd. (Golder) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty, expressed or implied is made.

Basis and Use of the Report: This report has been prepared for the specific site, design objective, development and purpose described to Golder by the Client. The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location. Any change of site conditions, purpose, development plans or if the project is not initiated within eighteen months of the date of the report may alter the validity of the report. Golder cannot be responsible for use of this report, or portions thereof, unless Golder is requested to review and, if necessary, revise the report.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without Golder's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, Golder may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to Golder. The report, all plans, data, drawings and other documents as well as all electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of Golder. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client can not rely upon the electronic media versions of Golder's report or other work products.

The report is of a summary nature and is not intended to stand alone without reference to the instructions given to Golder by the Client, communications between Golder and the Client, and to any other reports prepared by Golder for the Client relative to the specific site described in the report. In order to properly understand the suggestions, recommendations and opinions expressed in this report, reference must be made to the whole of the report. Golder can not be responsible for use of portions of the report without reference to the entire report.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project. The extent and detail of investigations, including the number of test holes, necessary to determine all of the relevant conditions which may affect construction costs would normally be greater than has been carried out for design purposes. Contractors bidding on, or undertaking the work, should rely on their own investigations, as well as their own interpretations of the factual data presented in the report, as to how subsurface conditions may affect their work, including but not limited to proposed construction techniques, schedule, safety and equipment capabilities.

Soil, Rock and Ground Water Conditions: Classification and identification of soils, rocks, and geologic units have been based on commonly accepted methods employed in the practice of geotechnical engineering and related disciplines. Classification and identification of the type and condition of these materials or units involves judgment, and boundaries between different soil, rock or geologic types or units may be transitional rather than abrupt. Accordingly, Golder does not warrant or guarantee the exactness of the descriptions.

Golder and the G logo are trademarks of Golder Associates Corporation

Special risks occur whenever engineering or related disciplines are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain subsurface conditions. The environmental, geologic, geotechnical, geochemical and hydrogeologic conditions that Golder interprets to exist between and beyond sampling points may differ from those that actually exist. In addition to soil variability, fill of variable physical and chemical composition can be present over portions of the site or on adjacent properties. The professional services retained for this project include only the geotechnical aspects of the subsurface conditions at the site, unless otherwise specifically stated and identified in the report. The presence or implication(s) of possible surface and/or subsurface contamination resulting from previous activities or uses of the site and/or resulting from the introduction onto the site of materials from off-site sources are outside the terms of reference for this project and have not been investigated or addressed.

Soil and groundwater conditions shown in the factual data and described in the report are the observed conditions at the time of their determination or measurement. Unless otherwise noted, those conditions form the basis of the recommendations in the report. Groundwater conditions may vary between and beyond reported locations and can be affected by annual, seasonal and meteorological conditions. The condition of the soil, rock and groundwater may be significantly altered by construction activities (traffic, excavation, groundwater level lowering, pile driving, blasting, etc.) on the site or on adjacent sites. Excavation may expose the soils to changes due to wetting, drying or frost. Unless otherwise indicated the soil must be protected from these changes during construction.

Sample Disposal: Golder will dispose of all uncontaminated soil and/or rock samples 90 days following issue of this report or, upon written request of the Client, will store uncontaminated samples and materials at the Client's expense. In the event that actual contaminated soils, fills or groundwater are encountered or are inferred to be present, all contaminated samples shall remain the property and responsibility of the Client for proper disposal.

Follow-Up and Construction Services: All details of the design were not known at the time of submission of Golder's report. Golder should be retained to review the final design, project plans and documents prior to construction, to confirm that they are consistent with the intent of Golder's report.

During construction, Golder should be retained to perform sufficient and timely observations of encountered conditions to confirm and document that the subsurface conditions do not materially differ from those interpreted conditions considered in the preparation of Golder's report and to confirm and document that construction activities do not adversely affect the suggestions, recommendations and opinions contained in Golder's report. Adequate field review, observation and testing during construction are necessary for Golder to be able to provide letters of assurance, in accordance with the requirements of many regulatory authorities. In cases where this recommendation is not followed, Golder's responsibility is limited to interpreting accurately the information encountered at the borehole locations, at the time of their initial determination or measurement during the preparation of the Report.

Changed Conditions and Drainage: Where conditions encountered at the site differ significantly from those anticipated in this report, either due to natural variability of subsurface conditions or construction activities, it is a condition of this report that Golder be notified of any changes and be provided with an opportunity to review or revise the recommendations within this report. Recognition of changed soil and rock conditions requires experience and it is recommended that Golder be employed to visit the site with sufficient frequency to detect if conditions have changed significantly.

Drainage of subsurface water is commonly required either for temporary or permanent installations for the project. Improper design or construction of drainage or dewatering can have serious consequences. Golder takes no responsibility for the effects of drainage unless specifically involved in the detailed design and construction monitoring of the system.

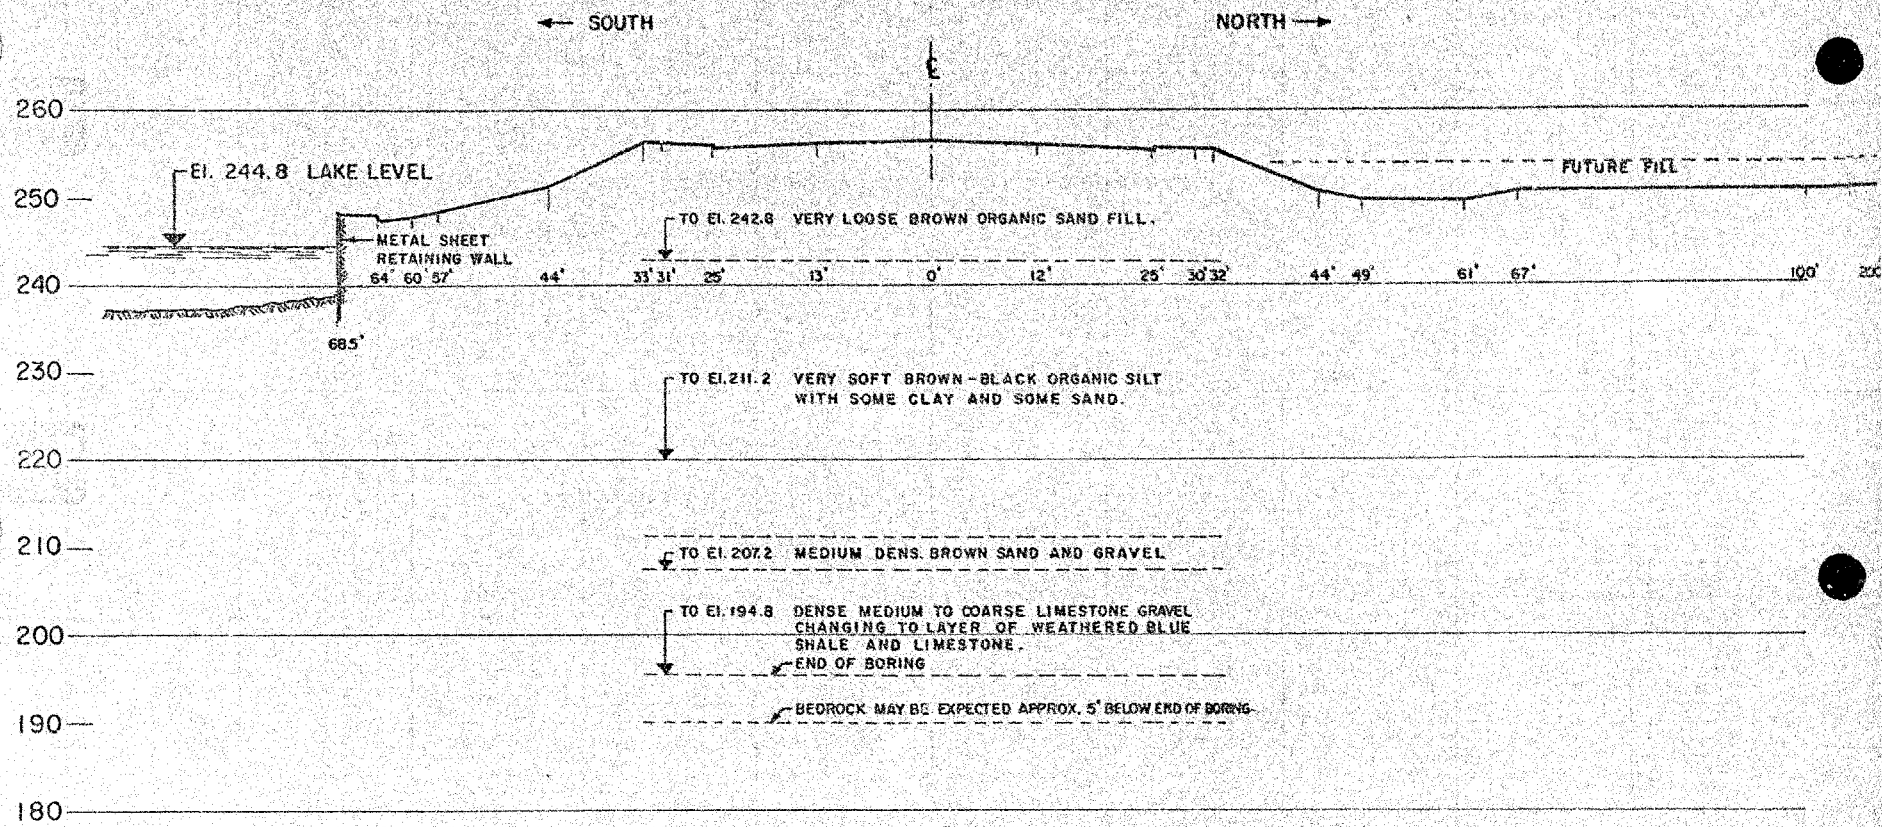
PORT CREDIT BRIDGE

SECTION THROUGH EAST APPROACH EMBANKMENT

FEB. 1966.



STA. 5+00

SCALE: 1" = 20'

DEFECTS IN NEGATIVE DUE TO CONDITION OF ORIGINAL DOCUMENT.

SUBSURFACE INVESTIGATION, PORT CREDIT ARENA, MISSISSAUGA, ONTARIO (PROJECT NO. 8411149), DATE JUNE 1984

The abbreviation commonly employed on each "Record of Borehole," on the figures and in the text of the report, are as follows:

I. SAMPLE TYPES

AS auger sample
CS chunk sample
DO drive open
DS Denison type sample
FS foil sample
RC rock core
ST slotted tube
TO thin-walled, open
TP thin-walled, piston
WS wash sample

II. PENETRATION RESISTANCES

Dynamic Penetration Resistance:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 0.3 m (12 in.).

Standard Penetration Resistance, *N*:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open sampler for a distance of 0.3 m (12 in.).

WH sampler advanced by static weight—weight, hammer

PH sampler advanced by pressure—pressure, hydraulic

PM sampler advanced by pressure—pressure, manual

III. SOIL DESCRIPTION

(a) *Cohesionless Soils*

Relative Density	*'N'* Blows/0.30m or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) *Cohesive Soils*

Consistency	*'Cu'* kPa	*'Cu'* psf.
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1000
Stiff	50 to 100	1000 to 2000
Very stiff	100 to 200	2000 to 4000
Hard	over 200	over 4000

IV. SOIL TESTS

C consolidation test
H hydrometer analysis
M sieve analysis
MH combined analysis, sieve and hydrometer[1]
Q undrained triaxial[2]
R consolidated undrained triaxial[2]
S drained triaxial
U unconfined compression
V field vane test

NOTES:
[1]Combined analyses when 5 to 95 per cent of the material passes the No. 200 sieve.
[2]Undrained triaxial tests in which pore pressures are measured are shown as $\bar{Q}$ or $\bar{R}$.

LIST OF SYMBOLS

I. GENERAL

$\pi = 3.1416$

e = base of natural logarithms 2.7183

$\log_e a$ or $\ln a$, natural logarithm of a

$\log_{10} a$ or $\log a$, logarithm of a to base 10

t	time
g	acceleration due to gravity
V	volume
W	weight
M	moment
F	factor of safety

II. STRESS AND STRAIN

u	pore pressure
σ	normal stress
σ'	normal effective stress ($\bar{\sigma}$ is also used)
τ	shear stress
ϵ	linear strain
ϵ_{xy}	shear strain
ν	Poisson's ratio (μ is also used)
E	modulus of linear deformation (Young's modulus)
G	modulus of shear deformation
K	modulus of compressibility
η	coefficient of viscosity

III. SOIL PROPERTIES

(a) *Unit weight*

γ	unit weight of soil (bulk density)
γ_s	unit weight of solid particles
γ_w	unit weight of water
γ_d	unit dry weight of soil (dry density)
γ'	unit weight of submerged soil
G_s	specific gravity of solid particles $G_s = \gamma_s/\gamma_w$
e	void ratio
n	porosity
w	water content
S_r	degree of saturation

(b) *Consistency*

w_L	liquid limit
w_P	plastic limit
I_P	plasticity index
w_S	shrinkage limit
I_L	liquidity index $= (w - w_P)/I_P$
I_C	consistency index $= (w_L - w)/I_P$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
D_r	relative density $= (e_{max} - e)/(e_{max} - e_{min})$

(c) *Permeability*

h	hydraulic head or potential
q	rate of discharge
v	velocity of flow
i	hydraulic gradient
k	coefficient of permeability
j	seepage force per unit volume

(d) *Consolidation (one-dimensional)*

m_v	coefficient of volume change $= -\Delta e/(1+e)\Delta\sigma'$
C_c	compression index $= -\Delta e/\Delta \log_{10} \sigma'$
c_v	coefficient of consolidation
T_v	time factor $= c_v t/d^2$ (d, drainage path)
U	degree of consolidation

(e) *Shear strength*

τ_f	shear strength	
c'	effective cohesion intercept	in terms of effective stress $\tau_f = c' + \sigma' \tan \phi'$
ϕ'	effective angle of shearing resistance, or friction	
c_u	apparent cohesion*	in terms of total stress $\tau_f = c_u + \sigma \tan \phi_u$
ϕ_u	apparent angle of shearing resistance, or friction	
μ	coefficient of friction	
S_t	sensitivity	

*For the case of a saturated cohesive soil, $\phi_u = 0$ and the undrained shear strength $\tau_f = c_u$ is taken as half the undrained compressive strength.

GEOTECHNICAL INVESTIGATION, LAKESHORE ROAD BRIDGE, CROSSING CREDIT RIVER, MISSISSAUGA, ONTARIO (PROJECT NO. 86112631), DATED OCTOBER 1986

LIST OF ABBREVIATIONS

The abbreviation commonly employed on each "Record of Borehole," on the figures and in the text of the report, are as follows:

I. SAMPLE TYPES

AS auger sample
CS chunk sample
DO drive open
DS Denison type sample
FS foil sample
RC rock core
ST slotted tube
TO thin-walled, open
TP thin-walled, piston
WS wash sample

II. PENETRATION RESISTANCES

Dynamic Penetration Resistance:

The number of blows by a 63.6 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 0.3 m (12 in.).

Standard Penetration Resistance, *N*:

The number of blows by a 63.6 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open sampler for a distance of 0.3 m (12 in.).

WH sampler advanced by static weight—weight, hammer

PH sampler advanced by pressure—pressure, hydraulic

PM sampler advanced by pressure—pressure, manual

III. SOIL DESCRIPTION

(a) *Cohesionless Soils*

Relative Density	*'N'* Blows/0.30m or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) *Cohesive Soils*

Consistency	*'Cu'* kPa	psf.
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1000
Stiff	50 to 100	1000 to 2000
Very stiff	100 to 200	2000 to 4000
Hard	over 200	over 4000

IV. SOIL TESTS

C consolidation test
H hydrometer analysis
M sieve analysis
MH combined analysis, sieve and hydrometer[1]
Q undrained triaxial[2]
R consolidated undrained triaxial[2]
S drained triaxial
U unconfined compression
V field vane test

NOTES:
[1]Combined analyses when 5 to 95 per cent of the material passes the No. 200 sieve.
[2]Undrained triaxial tests in which pore pressures are measured are shown as $\bar{Q}$ or $\bar{R}$.

LIST OF SYMBOLS

I. GENERAL

$\pi = 3.1416$

e = base of natural logarithms 2.7183

$\log_e a$ or $\ln a$, natural logarithm of a

$\log_{10} a$ or $\log a$, logarithm of a to base 10

t	time
g	acceleration due to gravity
V	volume
W	weight
M	moment
F	factor of safety

II. STRESS AND STRAIN

u	pore pressure
σ	normal stress
σ'	normal effective stress ($\bar{\sigma}$ is also used)
τ	shear stress
ϵ	linear strain
ϵ_{xy}	shear strain
ν	Poisson's ratio (μ is also used)
E	modulus of linear deformation (Young's modulus)
G	modulus of shear deformation
K	modulus of compressibility
η	coefficient of viscosity

III. SOIL PROPERTIES

(a) *Unit weight*

γ	unit weight of soil (bulk density)
γ_s	unit weight of solid particles
γ_w	unit weight of water
γ_d	unit dry weight of soil (dry density)
γ'	unit weight of submerged soil
G_s	specific gravity of solid particles $G_s = \gamma_s/\gamma_w$
e	void ratio
n	porosity
w	water content
S_r	degree of saturation

(b) *Consistency*

w_L	liquid limit
w_P	plastic limit
I_P	plasticity index
w_S	shrinkage limit
I_L	liquidity index $= (w - w_P)/I_P$
I_C	consistency index $= (w_L - w)/I_P$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
D_r	relative density $= (e_{max} - e)/(e_{max} - e_{min})$

(c) *Permeability*

h	hydraulic head or potential
q	rate of discharge
v	velocity of flow
i	hydraulic gradient
k	coefficient of permeability
j	seepage force per unit volume

(d) *Consolidation (one-dimensional)*

m_v	coefficient of volume change $= -\Delta e/(1+e)\Delta\sigma'$
C_c	compression index $= -\Delta e/\Delta \log_{10} \sigma'$
c_v	coefficient of consolidation
T_v	time factor $= c_v t/d^2$ (d, drainage path)
U	degree of consolidation

(e) *Shear strength*

τ_f	shear strength	
c'	effective cohesion intercept	in terms of effective stress $\tau_f = c' + \sigma' \tan \phi'$
ϕ'	effective angle of shearing resistance, or friction	
c_u	apparent cohesion*	in terms of total stress $\tau_f = c_u + \sigma \tan \phi_u$
ϕ_u	apparent angle of shearing resistance, or friction	
μ	coefficient of friction	
S_t	sensitivity	

*For the case of a saturated cohesive soil, $\phi_u = 0$ and the undrained shear strength $\tau_f = c_u$ is taken as half the undrained compressive strength.

SUPPLEMENTARY GEOTECHNICAL INVESTIGATION, LAKESHORE ROAD BRIDGE OVER CREDIT RIVER, PORT CREDIT, ON (PROJECT NO. 86112631) DATED DECEMBER 1986

LIST OF ABBREVIATIONS

The abbreviation commonly employed on each "Record of Borehole," on the figures and in the text of the report, are as follows:

I. SAMPLE TYPES

AS auger sample
CS chunk sample
DO drive open
DS Denison type sample
FS foil sample
RC rock core
ST slotted tube
TO thin-walled, open
TP thin-walled, piston
WS wash sample

II. PENETRATION RESISTANCES

Dynamic Penetration Resistance:

The number of blows by a 63.6 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 0.3 m (12 in.).

Standard Penetration Resistance, *N*:

The number of blows by a 63.6 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open sampler for a distance of 0.3 m (12 in.).

WH sampler advanced by static weight—weight, hammer

PH sampler advanced by pressure—pressure, hydraulic

PM sampler advanced by pressure—pressure, manual

III. SOIL DESCRIPTION

(a) *Cohesionless Soils*

Relative Density	*'N'* Blows/0.30m or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) *Cohesive Soils*

Consistency	*'Cu'* kPa	*'Cu'* psf.
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1000
Stiff	50 to 100	1000 to 2000
Very stiff	100 to 200	2000 to 4000
Hard	over 200	over 4000

IV. SOIL TESTS

C consolidation test
H hydrometer analysis
M sieve analysis
MH combined analysis, sieve and hydrometer[1]
Q undrained triaxial[2]
R consolidated undrained triaxial[2]
S drained triaxial
U unconfined compression
V field vane test

NOTES:
[1]Combined analyses when 5 to 95 per cent of the material passes the No. 200 sieve.
[2]Undrained triaxial tests in which pore pressures are measured are shown as $\bar{Q}$ or $\bar{R}$.

Form...G.A.-R-1 (m)

LIST OF SYMBOLS

I. GENERAL

π = 3.1416

n	porosity
w	water content
S_r	degree of saturation

(b) *Consistency*

w_L	liquid limit
w_P	plastic limit
I_P	plasticity index
w_S	shrinkage limit
I_L	liquidity index $= (w - w_P)/I_P$
I_C	consistency index $= (w_L - w)/I_P$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
D_r	relative density $= (e_{max} - e)/(e_{max} - e_{min})$

(c) *Permeability*

h	hydraulic head or potential
q	rate of discharge
v	velocity of flow
i	hydraulic gradient
k	coefficient of permeability
j	seepage force per unit volume

(d) *Consolidation (one-dimensional)*

m_v	coefficient of volume change $= -\Delta e/(1+e)\Delta\sigma'$
C_c	compression index $= -\Delta e/\Delta \log_{10} \sigma'$
c_v	coefficient of consolidation
T_v	time factor $= c_v t/d^2$ (d, drainage path)
U	degree of consolidation

(e) *Shear strength*

τ_f	shear strength	
c'	effective cohesion intercept	in terms of effective stress $\tau_f = c' + \sigma' \tan \phi'$
ϕ'	effective angle of shearing resistance, or friction	
c_u	apparent cohesion*	in terms of total stress $\tau_f = c_u + \sigma \tan \phi_u$
ϕ_u	apparent angle of shearing resistance, or friction	
μ	coefficient of friction	
S_t	sensitivity	

*For the case of a saturated cohesive soil, $\phi_u = 0$ and the undrained shear strength $\tau_f = c_u$ is taken as half the undrained compressive strength.

GEOTECHNICAL INVESTIGATION, PROPOSED FORCEMAIN, PORT CREDIT, ONTARIO, (PROJECT NO. 89113231), DATED NOVEMBER 1991

LIST OF SYMBOLS

I. GENERAL

$\pi = 3.1416$

e = base of natural logarithms 2.7183

$\log_e a$ or $\ln a$, natural logarithm of a

$\log_{10} a$ or $\log a$, logarithm of a to base 10

t	time
g	acceleration due to gravity
V	volume
W	weight
M	moment
F	factor of safety

II. STRESS AND STRAIN

u	pore pressure
σ	normal stress
σ'	normal effective stress ($\bar{\sigma}$ is also used)
τ	shear stress
ϵ	linear strain
ϵ_{xy}	shear strain
ν	Poisson's ratio (μ is also used)
E	modulus of linear deformation (Young's modulus)
G	modulus of shear deformation
K	modulus of compressibility
η	coefficient of viscosity

III. SOIL PROPERTIES

(a) *Unit weight*

γ	unit weight of soil (bulk density)
γ_s	unit weight of solid particles
γ_w	unit weight of water
γ_d	unit dry weight of soil (dry density)
γ'	unit weight of submerged soil
G_s	specific gravity of solid particles $G_s = \gamma_s/\gamma_w$
e	void ratio
n	porosity
w	water content
S_r	degree of saturation

(b) *Consistency*

w_L	liquid limit
w_P	plastic limit
I_P	plasticity index
w_S	shrinkage limit
I_L	liquidity index $= (w - w_P)/I_P$
I_C	consistency index $= (w_L - w)/I_P$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
D_r	relative density $= (e_{max} - e)/(e_{max} - e_{min})$

(c) *Permeability*

h	hydraulic head or potential
q	rate of discharge
v	velocity of flow
i	hydraulic gradient
k	coefficient of permeability
j	seepage force per unit volume

(d) *Consolidation (one-dimensional)*

m_v	coefficient of volume change $= -\Delta e/(1+e)\Delta\sigma'$
C_c	compression index $= -\Delta e/\Delta \log_{10} \sigma'$
c_v	coefficient of consolidation
T_v	time factor $= c_v t/d^2$ (d, drainage path)
U	degree of consolidation

(e) *Shear strength*

τ_f	shear strength	
c'	effective cohesion intercept	in terms of effective stress $\tau_f = c' + \sigma' \tan \phi'$
ϕ'	effective angle of shearing resistance, or friction	
c_u	apparent cohesion*	in terms of total stress $\tau_f = c_u + \sigma \tan \phi_u$
ϕ_u	apparent angle of shearing resistance, or friction	
μ	coefficient of friction	
S_t	sensitivity	

*For the case of a saturated cohesive soil, $\phi_u = 0$ and the strength $\tau_f = c_u$ is taken as half the undrained compressive strength.

LIST OF ABBREVIATIONS

The abbreviation commonly employed on each "Record of Borehole," on the figures and in the text of the report, are as follows:

I. SAMPLE TYPES

AS auger sample
CS chunk sample
DO drive open
DS Denison type sample
FS foil sample
RC rock core
ST slotted tube
TO thin-walled, open
TP thin-walled, piston
WS wash sample

II. PENETRATION RESISTANCES

Dynamic Penetration Resistance:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 0.3 m (12 in.).

Standard Penetration Resistance, *N*:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open sampler for a distance of 0.3 m (12 in.).

WH sampler advanced by static weight—weight, hammer

PH sampler advanced by pressure—pressure, hydraulic

PM sampler advanced by pressure—pressure, manual

III. SOIL DESCRIPTION

(a) *Cohesionless Soils*

Relative Density	'N' Blows/0.30m or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) *Cohesive Soils*

Consistency	'Cu' kPa	'Cu' psf.
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1000
Stiff	50 to 100	1000 to 2000
Very stiff	100 to 200	2000 to 4000
Hard	over 200	over 4000

IV. SOIL TESTS

C consolidation test
H hydrometer analysis
M sieve analysis
MH combined analysis, sieve and hydrometer[1]
Q undrained triaxial[2]
R consolidated undrained triaxial[2]
S drained triaxial
U unconfined compression
V field vane test

NOTES:
[1]Combined analyses when 5 to 95 per cent of the material passes the No. 200 sieve.
[2]Undrained triaxial tests in which pore pressures are measured are shown as $\bar{Q}$ or $\bar{R}$.

SUPPLEMENTARY GEOTECHNICAL INVESTIGATION, PROPOSED FORCEMAIN, PORT CREDIT, ONTARIO, (PROJECT NO. 89113232), DATED NOVEMBER 1991

LIST OF ABBREVIATIONS

The abbreviation commonly employed on each "Record of Borehole," on the figures and in the text of the report, are as follows:

I. SAMPLE TYPES

AS auger sample
CS chunk sample
DO drive open
DS Denison type sample
FS foil sample
RC rock core
ST slotted tube
TO thin-walled, open
TP thin-walled, piston
WS wash sample

II. PENETRATION RESISTANCES

Dynamic Penetration Resistance:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 0.3 m (12 in.).

Standard Penetration Resistance, *N*:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) drive open sampler for a distance of 0.3 m (12 in.).

WH sampler advanced by static weight—weight, hammer

PH sampler advanced by pressure—pressure, hydraulic

PM sampler advanced by pressure—pressure, manual

III. SOIL DESCRIPTION

(a) *Cohesionless Soils*

Relative Density	*'N'* Blows/0.30m or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) *Cohesive Soils*

Consistency	*'Cu'* kPa	*'Cu'* psf.
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1000
Stiff	50 to 100	1000 to 2000
Very stiff	100 to 200	2000 to 4000
Hard	over 200	over 4000

IV. SOIL TESTS

C consolidation test
H hydrometer analysis
M sieve analysis
MH combined analysis, sieve and hydrometer[1]
Q undrained triaxial[2]
R consolidated undrained triaxial[2]
S drained triaxial
U unconfined compression
V field vane test

NOTES:
[1]Combined analyses when 5 to 95 per cent of the material passes the No. 200 sieve.
[2]Undrained triaxial tests in which pore pressures are measured are shown as $\bar{Q}$ or $\bar{R}$.

LIST OF SYMBOLS

I. GENERAL

$\pi = 3.1416$

e = base of natural logarithms 2.7183

$\log_e a$ or $\ln a$, natural logarithm of a

$\log_{10} a$ or $\log a$, logarithm of a to base 10

t	time
g	acceleration due to gravity
V	volume
W	weight
M	moment
F	factor of safety

II. STRESS AND STRAIN

u	pore pressure
σ	normal stress
σ'	normal effective stress ($\bar{\sigma}$ is also used)
τ	shear stress
ϵ	linear strain
ϵ_{xy}	shear strain
ν	Poisson's ratio (μ is also used)
E	modulus of linear deformation (Young's modulus)
G	modulus of shear deformation
K	modulus of compressibility
η	coefficient of viscosity

III. SOIL PROPERTIES

(a) *Unit weight*

γ	unit weight of soil (bulk density)
γ_s	unit weight of solid particles
γ_w	unit weight of water
γ_d	unit dry weight of soil (dry density)
γ'	unit weight of submerged soil
G_s	specific gravity of solid particles $G_s = \gamma_s/\gamma_w$
e	void ratio
n	porosity
w	water content
S_r	degree of saturation

(b) *Consistency*

w_L	liquid limit
w_P	plastic limit
I_P	plasticity index
w_S	shrinkage limit
I_L	liquidity index $= (w - w_P)/I_P$
I_C	consistency index $= (w_L - w)/I_P$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
D_r	relative density $= (e_{max} - e)/(e_{max} - e_{min})$

(c) *Permeability*

h	hydraulic head or potential
q	rate of discharge
v	velocity of flow
i	hydraulic gradient
k	coefficient of permeability
j	seepage force per unit volume

(d) *Consolidation (one-dimensional)*

m_v	coefficient of volume change $= -\Delta e/(1+e)\Delta\sigma'$
C_c	compression index $= -\Delta e/\Delta \log_{10} \sigma'$
c_v	coefficient of consolidation
T_v	time factor $= c_v t/d^2$ (d, drainage path)
U	degree of consolidation

(e) *Shear strength*

τ_f	shear strength	
c'	effective cohesion intercept	in terms of effective stress $\tau_f = c' + \sigma' \tan \phi'$
ϕ'	effective angle of shearing resistance, or friction	
c_u	apparent cohesion*	in terms of total stress $\tau_f = c_u + \sigma \tan \phi_u$
ϕ_u	apparent angle of shearing resistance, or friction	
μ	coefficient of friction	
S_t	sensitivity	

*For the case of a saturated cohesive soil, $\phi_u = 0$ and the strength $\tau_f = c_u$ is taken as half the undrained compressive strength.

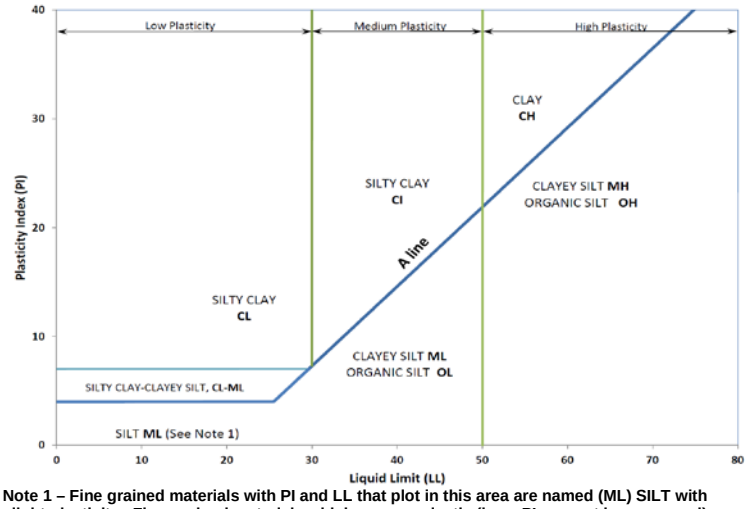
PRELIMINARY GROUND INVESTIGATION AND DESIGN REPORT, GO TRANSIT-METROLINX CROSSING, PORT CREDIT GO STATION, HURONTARIO/MAIN LIGHT RAIL TRANSIT (HMLRT), MISSISSAUGA, ONTARIO, DATED AUGUST 2013

METHOD OF SOIL CLASSIFICATION

The Golder Associates Ltd. Soil Classification System is based on the Unified Soil Classification System (USCS)

Organic or Inorganic	Soil Group	Type of Soil		Gradation or Plasticity	$Cu = \frac{D_{60}}{D_{10}}$	$Cc = \frac{(D_{30})^2}{D_{10} x D_{60}}$	Organic Content	USCS Group Symbol	Group Name
INORGANIC (Organic Content ≤30% by mass)	COARSE-GRAINED SOILS (>50% by mass is larger than 0.075 mm)	GRAVELS (>50% by mass of coarse fraction is larger than 4.75 mm)	Gravels with ≤12% fines (by mass)	Poorly Graded	<4	≤1 or ≥3	≤30%	GP	GRAVEL
				Well Graded	≥4	1 to 3		GW	GRAVEL
			Gravels with >12% fines (by mass)	Below A Line	n/a			GM	SILTY GRAVEL
				Above A Line	n/a			GC	CLAYEY GRAVEL
		SANDS (≥50% by mass of coarse fraction is smaller than 4.75 mm)	Sands with ≤12% fines (by mass)	Poorly Graded	<6	≤1 or ≥3		SP	SAND
				Well Graded	≥6	1 to 3		SW	SAND
			Sands with >12% fines (by mass)	Below A Line	n/a			SM	SILTY SAND
				Above A Line	n/a			SC	CLAYEY SAND

Organic or Inorganic	Soil Group	Type of Soil		Laboratory Tests	Field Indicators					Organic Content	USCS Group Symbol	Primary Name
					Dilatancy	Dry Strength	Shine Test	Thread Diameter	Toughness (of 3 mm thread)			
INORGANIC (Organic Content ≤30% by mass)	FINE-GRAINED SOILS (≥50% by mass is smaller than 0.075 mm)	SILTS (Non-Plastic or PI and LL plot below A-Line on Plasticity Chart below)		Liquid Limit <50	Rapid	None	None	>6 mm	N/A (can't roll 3 mm thread)	<5%	ML	SILT
					Slow	None to Low	Dull	3mm to 6 mm	None to low	<5%	ML	CLAYEY SILT
					Slow to very slow	Low to medium	Dull to slight	3mm to 6 mm	Low	5% to 30%	OL	ORGANIC SILT
				Liquid Limit ≥50	Slow to very slow	Low to medium	Slight	3mm to 6 mm	Low to medium	<5%	MH	CLAYEY SILT
					None	Medium to high	Dull to slight	1 mm to 3 mm	Medium to high	5% to 30%	OH	ORGANIC SILT
		CLAYS (PI and LL plot above A-Line on Plasticity Chart below)		Liquid Limit <30	None	Low to medium	Slight to shiny	~ 3 mm	Low to medium	0% to 30% (see Note 2)	CL	SILTY CLAY
				Liquid Limit 30 to 50	None	Medium to high	Slight to shiny	1 mm to 3 mm	Medium		CI	SILTY CLAY
				Liquid Limit ≥50	None	High	Shiny	<1 mm	High		CH	CLAY
HIGHLY ORGANIC SOILS (Organic Content >30% by mass)		Peat and mineral soil mixtures								30% to 75%	PT	SILTY PEAT, SANDY PEAT
		Predominantly peat, may contain some mineral soil, fibrous or amorphous peat								75% to 100%		PEAT



Note 1 – Fine grained materials with PI and LL that plot in this area are named (ML) SILT with slight plasticity. Fine-grained materials which are non-plastic (i.e. a PL cannot be measured) are named SILT.
Note 2 – For soils with <5% organic content, include the descriptor "trace organics" for soils with between 5% and 30% organic content include the prefix "organic" before the Primary name.

Dual Symbol — A dual symbol is two symbols separated by a hyphen, for example, GP-GM, SW-SC and CL-ML.
For non-cohesive soils, the dual symbols must be used when the soil has between 5% and 12% fines (i.e. to identify transitional material between "clean" and "dirty" sand or gravel.
For cohesive soils, the dual symbol must be used when the liquid limit and plasticity index values plot in the CL-ML area of the plasticity chart (see Plasticity Chart at left).

Borderline Symbol — A borderline symbol is two symbols separated by a slash, for example, CL/CI, GM/SM, CL/ML.
A borderline symbol should be used to indicate that the soil has been identified as having properties that are on the transition between similar materials. In addition, a borderline symbol may be used to ~~or~~ indicate~~s~~ a range of similar soil types within a stratum.

ABBREVIATIONS AND TERMS USED ON RECORDS OF BOREHOLES AND TEST PITS

PARTICLE SIZES OF CONSTITUENTS

Soil Constituent	Particle Size Description	Millimetres	Inches (US Std. Sieve Size)
BOULDERS	Not Applicable	>300	>12
COBBLES	Not Applicable	75 to 300	3 to 12
GRAVEL	Coarse Fine	19 to 75 4.75 to 19	0.75 to 3 (4) to 0.75
SAND	Coarse Medium Fine	2.00 to 4.75 0.425 to 2.00 0.075 to 0.425	(10) to (4) (40) to (10) (200) to (40)
SILT/CLAY	Classified by plasticity	<0.075	< (200)

MODIFIERS FOR SECONDARY AND MINOR CONSTITUENTS

Percentage by Mass	Modifier
>35	Use 'and' to combine major constituents (*i.e.,* SAND and GRAVEL, SAND and CLAY)
> 12 to 35	Primary soil name prefixed with "gravelly, sandy, SILTY, CLAYEY" as applicable
> 5 to 12	some
≤ 5	trace

PENETRATION RESISTANCE

Standard Penetration Resistance (SPT), N:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) split-spoon sampler for a distance of 300 mm (12 in.).

Cone Penetration Test (CPT)

An electronic cone penetrometer with a 60° conical tip and a project end area of 10 cm^2 pushed through ground at a penetration rate of 2 cm/s. Measurements of tip resistance (q_t), porewater pressure (u) and sleeve frictions are recorded electronically at 25 mm penetration intervals.

Dynamic Cone Penetration Resistance (DCPT); N_d:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in.) to drive uncased a 50 mm (2 in.) diameter, 60° cone attached to "A" size drill rods for a distance of 300 mm (12 in.).

PH: Sampler advanced by hydraulic pressure
PM: Sampler advanced by manual pressure
WH: Sampler advanced by static weight of hammer
WR: Sampler advanced by weight of sampler and rod

SAMPLES

AS	Auger sample
BS	Block sample
CS	Chunk sample
DO or DP	Seamless open ended, driven or pushed tube sampler – note size
DS	Denison type sample
FS	Foil sample
RC	Rock core
SC	Soil core
SS	Split spoon sampler – note size
ST	Slotted tube
TO	Thin-walled, open – note size
TP	Thin-walled, piston – note size
WS	Wash sample

SOIL TESTS

w	water content
PL , w_p	plastic limit
LL , w_L	liquid limit
C	consolidation (oedometer) test
CHEM	chemical analysis (refer to text)
CID	consolidated isotropically drained triaxial test[1]
CIU	consolidated isotropically undrained triaxial test with porewater pressure measurement[1]
D_R	relative density (specific gravity, Gs)
DS	direct shear test
GS	specific gravity
M	sieve analysis for particle size
MH	combined sieve and hydrometer (H) analysis
MPC	Modified Proctor compaction test
SPC	Standard Proctor compaction test
OC	organic content test
SO_4	concentration of water-soluble sulphates
UC	unconfined compression test
UU	unconsolidated undrained triaxial test
V (FV)	field vane (LV-laboratory vane test)
γ	unit weight

1. Tests which are anisotropically consolidated prior to shear are shown as CAD, CAU.

NON-COHESIVE (COHESIONLESS) SOILS

Compactness[2]

Term	SPT 'N' (blows/0.3m)[1]
Very Loose	0 - 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very Dense	>50

1. SPT 'N' in accordance with ASTM D1586, uncorrected for overburden pressure effects.
2. Definition of compactness descriptions based on SPT 'N' ranges from Terzaghi and Peck (1967) and correspond to typical average N_{60} values.

Field Moisture Condition

Term	Description
Dry	Soil flows freely through fingers.
Moist	Soils are darker than in the dry condition and may feel cool.
Wet	As moist, but with free water forming on hands when handled.

COHESIVE SOILS

Consistency

Term	Undrained Shear Strength (kPa)	SPT 'N'[1] (blows/0.3m)
Very Soft	<12	0 to 2
Soft	12 to 25	2 to 4
Firm	25 to 50	4 to 8
Stiff	50 to 100	8 to 15
Very Stiff	100 to 200	15 to 30
Hard	>200	>30

1. SPT 'N' in accordance with ASTM D1586, uncorrected for overburden pressure effects; approximate only.

Water Content

Term	Description
w < PL	Material is estimated to be drier than the Plastic Limit.
w ~ PL	Material is estimated to be close to the Plastic Limit.
w > PL	Material is estimated to be wetter than the Plastic Limit.

LIST OF SYMBOLS

Unless otherwise stated, the symbols employed in the report are as follows:

I. GENERAL

π	3.1416
ln x	natural logarithm of x
$\log_{10}$	x or log x, logarithm of x to base 10
g	acceleration due to gravity
t	time

II. STRESS AND STRAIN

γ	shear strain
Δ	change in, e.g. in stress: $\Delta\sigma$
ε	linear strain
ε_v	volumetric strain
η	coefficient of viscosity
υ	Poisson's ratio
σ	total stress
σ'	effective stress ($\sigma' = \sigma - u$)
σ'_{vo}	initial effective overburden stress
σ_1, σ_2, σ_3	principal stress (major, intermediate, minor)
σ_{oct}	mean stress or octahedral stress $= (\sigma_1 + \sigma_2 + \sigma_3)/3$
τ	shear stress
u	porewater pressure
E	modulus of deformation
G	shear modulus of deformation
K	bulk modulus of compressibility

III. SOIL PROPERTIES

(a) Index Properties

$\rho(\gamma)$	bulk density (bulk unit weight)*
$\rho_d(\gamma_d)$	dry density (dry unit weight)
$\rho_w(\gamma_w)$	density (unit weight) of water
$\rho_s(\gamma_s)$	density (unit weight) of solid particles
γ'	unit weight of submerged soil ($\gamma' = \gamma - \gamma_w$)
D_R	relative density (specific gravity) of solid particles ($D_R = \rho_s / \rho_w$) (formerly G_s)
e	void ratio
n	porosity
S	degree of saturation

* Density symbol is ρ. Unit weight symbol is γ where $\gamma = \rho g$ (i.e. mass density multiplied by acceleration due to gravity)

(a) Index Properties (continued)

w	water content
w_l or LL	liquid limit
w_p or PL	plastic limit
I_p or PI	plasticity index = $(w_l - w_p)$
w_s	shrinkage limit
I_L	liquidity index = $(w - w_p) / I_p$
I_C	consistency index = $(w_l - w) / I_p$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
I_D	density index = $(e_{max} - e) / (e_{max} - e_{min})$ (formerly relative density)

(b) Hydraulic Properties

h	hydraulic head or potential
q	rate of flow
v	velocity of flow
i	hydraulic gradient
k	hydraulic conductivity (coefficient of permeability)
j	seepage force per unit volume

(c) Consolidation (one-dimensional)

C_c	compression index (normally consolidated range)
C_r	recompression index (over-consolidated range)
C_s	swelling index
C_α	secondary compression index
m_v	coefficient of volume change
c_v	coefficient of consolidation (vertical direction)
c_h	coefficient of consolidation (horizontal direction)
T_v	time factor (vertical direction)
U	degree of consolidation
σ'_p	pre-consolidation stress
OCR	over-consolidation ratio = σ'_p / σ'_{vo}

(d) Shear Strength

τ_p, τ_r	peak and residual shear strength
ϕ'	effective angle of internal friction
δ	angle of interface friction
μ	coefficient of friction = tan δ
c′	effective cohesion
c_u, s_u	undrained shear strength ($\phi = 0$ analysis)
p	mean total stress $(\sigma_1 + \sigma_3)/2$
p′	mean effective stress $(\sigma'_1 + \sigma'_3)/2$
q	$(\sigma_1 - \sigma_3)/2$ or $(\sigma'_1 - \sigma'_3)/2$
q_u	compressive strength $(\sigma_1 - \sigma_3)$
S_t	sensitivity

Notes: 1 $\tau = c' + \sigma' \tan \phi'$

2 shear strength = (compressive strength)/2

LITHOLOGICAL AND GEOTECHNICAL ROCK DESCRIPTION TERMINOLOGY

WEATHERINGS STATE

Fresh: no visible sign of weathering

Faintly weathered: weathering limited to the surface of major discontinuities.

Slightly weathered: penetrative weathering developed on open discontinuity surfaces but only slight weathering of rock material.

Moderately weathered: weathering extends throughout the rock mass but the rock material is not friable.

Highly weathered: weathering extends throughout rock mass and the rock material is partly friable.

Completely weathered: rock is wholly decomposed and in a friable condition but the rock and structure are preserved.

BEDDING THICKNESS

Description	Bedding Plane Spacing
Very thickly bedded	Greater than 2 m
Thickly bedded	0.6 m to 2 m
Medium bedded	0.2 m to 0.6 m
Thinly bedded	60 mm to 0.2 m
Very thinly bedded	20 mm to 60 mm
Laminated	6 mm to 20 mm
Thinly laminated	Less than 6 mm

JOINT OR FOLIATION SPACING

Description	Spacing
Very wide	Greater than 3 m
Wide	1 m to 3 m
Moderately close	0.3 m to 1 m
Close	50 mm to 300 mm
Very close	Less than 50 mm

GRAIN SIZE

Term	Size*
Very Coarse Grained	Greater than 60 mm
Coarse Grained	2 mm to 60 mm
Medium Grained	60 microns to 2 mm
Fine Grained	2 microns to 60 microns
Very Fine Grained	Less than 2 microns

Note: * Grains greater than 60 microns diameter are visible to the naked eye.

CORE CONDITION

Total Core Recovery (TCR)
The percentage of solid drill core recovered regardless of quality or length, measured relative to the length of the total core run.

Solid Core Recovery (SCR)
The percentage of solid drill core, regardless of length, recovered at full diameter, measured relative to the length of the total core run.

Rock Quality Designation (RQD)
The percentage of solid drill core, greater than 100 mm length, recovered at full diameter, measured relative to the length of the total core run. RQD varied from 0% for completely broken core to 100% for core in solid sticks.

DISCONTINUITY DATA

Fracture Index
A count of the number of discontinuities (physical separations) in the rock core, including both naturally occurring fractures and mechanically induced breaks caused by drilling.

Dip with Respect to Core Axis
The angle of the discontinuity relative to the axis (length) of the core. In a vertical borehole a discontinuity with a 90^{o} angle is horizontal.

Description and Notes
An abbreviation description of the discontinuities, whether naturally occurring separations such as fractures, bedding planes and foliation planes or mechanically induced features caused by drilling such as ground or shattered core and mechanically separated bedding or foliation surfaces. Additional information concerning the nature of fracture surfaces and infillings are also noted.

Abbreviations

JN	Joint	PL	Planar
FLT	Fault	CU	Curved
SH	Shear	UN	Undulating
VN	Vein	IR	Irregular
FR	Fracture	K	Slickensided
SY	Stylolite	PO	Polished
BD	Bedding	SM	Smooth
FO	Foliation	SR	Slightly Rough
CO	Contact	RO	Rough
AXJ	Axial Joint	VR	Very Rough
KV	Karstic Void		
MB	Mechanical Break

Notes on Sample Descriptions

1. All sample descriptions included in this report generally follow the Unified Soil Classification. Laboratory grain size analyses provided by SPL also follow the same system. Different classification systems may be used by others, such as the system by the International Society for Soil Mechanics and Foundation Engineering (ISSMFE). Please note that, with the exception of those samples where a grain size analysis and/or Atterberg Limits testing have been made, all samples are classified visually. Visual classification is not sufficiently accurate to provide exact grain sizing or precise differentiation between size classification systems.

ISSMFE SOIL CLASSIFICATION

CLAY	SILT			SAND			GRAVEL			COBBLES	BOULDERS
	FINE	MEDIUM	COARSE	FINE	MEDIUM	COARSE	FINE	MEDIUM	COARSE		

EQUIVALENT GRAIN DIAMETER IN MILLIMETRES

CLAY (PLASTIC) TO	FINE	MEDIUM	CRS.	FINE	COARSE
SILT (NONPLASTIC)	SAND			GRAVEL	

UNIFIED SOIL CLASSIFICATION

2. Fill: Where fill is designated on the borehole log it is defined as indicated by the sample recovered during the boring process. The reader is cautioned that fills are heterogeneous in nature and variable in density or degree of compaction. The borehole description may therefore not be applicable as a general description of site fill materials. All fills should be expected to contain obstruction such as wood, large concrete pieces or subsurface basements, floors, tanks, etc., none of these may have been encountered in the boreholes. Since boreholes cannot accurately define the contents of the fill, test pits are recommended to provide supplementary information. Despite the use of test pits, the heterogeneous nature of fill will leave some ambiguity as to the exact composition of the fill. Most fills contain pockets, seams, or layers of organically contaminated soil. This organic material can result in the generation of methane gas and/or significant ongoing and future settlements. Fill at this site may have been monitored for the presence of methane gas and, if so, the results are given on the borehole logs. The monitoring process does not indicate the volume of gas that can be potentially generated nor does it pinpoint the source of the gas. These readings are to advice of the presence of gas only, and a detailed study is recommended for sites where any explosive gas/methane is detected. Some fill material may be contaminated by toxic/hazardous waste that renders it unacceptable for deposition in any but designated land fill sites; unless specifically stated the fill on this site has not been tested for contaminants that may be considered toxic or hazardous. This testing and a potential hazard study can be undertaken if requested. In most residential/commercial areas undergoing reconstruction, buried oil tanks are common and are generally not detected in a conventional preliminary geotechnical site investigation.

3. Till: The term till on the borehole logs indicates that the material originates from a geological process associated with glaciation. Because of this geological process the till must be considered heterogeneous in composition and as such may contain pockets and/or seams of material such as sand, gravel, silt or clay. Till often contains cobbles (60 to 200 mm) or boulders (over 200 mm). Contractors may therefore encounter cobbles and boulders during excavation, even if they are not indicated by the borings. It should be appreciated that normal sampling equipment cannot differentiate the size or type of any obstruction. Because of the horizontal and vertical variability of till, the sample description may be applicable to a very limited zone; caution is therefore essential when dealing with sensitive excavations or dewatering programs in till materials.

Explanation of Terms Used in the Record of Boreholes

Sample Type

AS	Auger sample
BS	Block sample
CS	Chunk sample
DO	Drive open
DS	Dimension type sample
FS	Foil sample
RC	Rock core
SC	Soil core
SS	Spoon sample
ST	Slotted tube
TO	Thin-walled, open
TP	Thin-walled, piston
WS	Wash sample

Penetration Resistance

Standard Penetration Resistance (SPT), N:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in) required to drive a 50 mm (2 in) drive open sampler for a distance of 300 mm (12 in).

Dynamic Cone Penetration Resistance, N_d:

The number of blows by a 63.5 kg (140 lb) hammer dropped 760 mm (30 in) to drive uncased a 50 mm (2 in) diameter, 60° cone attached to "A" size drill rods for a distance of 300 mm (12 in).

Textural Classification of Soils

Classification	Particle Size
Boulders	>300 mm
Cobbles	75 mm-300 mm
Gravel	4.75 mm-75 mm
Sand	0.075 mm-4.75 mm
Silt	0.002 mm-0.075 mm
Clay	<0.002 mm

Coarse Grain Soil Description (50% greater than 0.075 mm)

Terminology	Proportion
Trace	0-10%
Some	10-20%
Adjective (e.g. silty or sandy)	20-40%
And (e.g. sand and gravel)	40-60%

Soil Description

a) Cohesive Soils

Consistency	Undrained Shear Strength (kPa)	SPT "N" Value
Very soft	<12	0-2
Soft	12-25	2-4
Firm	25-50	4-8
Stiff	50-100	8-15
Very stiff	100-200	15-30
Hard	>200	>30

b) Cohesionless Soils

Density Index (Relative Density)	SPT "N" Value
Very loose	<4
Loose	4-10
Compact	10-30
Dense	30-50
Very dense	>50

Soil Tests

w	Water content
w_p	Plastic limit
w_l	Liquid limit
C	Consolidation (oedometer) test
CID	Consolidated isotropically drained triaxial test
CIU	consolidated isotropically undrained triaxial test with porewater pressure measurement
D_R	Relative density (specific gravity, Gs)
DS	Direct shear test
ENV	Environmental/ chemical analysis
M	Sieve analysis for particle size
MH	Combined sieve and hydrometer (H) analysis
MPC	Modified proctor compaction test
SPC	Standard proctor compaction test
OC	Organic content test
U	Unconsolidated Undrained Triaxial Test
V	Field vane (LV-laboratory vane test)
γ	Unit weight

APPENDIX B

MECP Well Record

1.0 INTRODUCTION

WSP Canada Inc. (WSP) has been retained by GM BluePlan Engineering Limited (GMBP) on behalf of the Region of Peel (the Region) to conduct hydrogeological studies as part of the Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Class EA (the Project) in the City of Mississauga, Region of Peel, Ontario. The purpose of the Project is to investigate alternative water and wastewater strategies for the Rosemere, Hiawatha, and Elmwood sewage pumping station (SPS) servicing areas, investigate alternative routes for the future Lakeshore sub-transmission watermain east of the credit river and to develop an integrated servicing strategy that supports existing servicing needs and projected growth.

As part of the evaluation and selection of alternatives for the Project, a desktop assessment is required to provide a summary of subsurface conditions within the study area (as defined by GMBP). The study area is shown on Figure 1 and is generally limited by Front Street in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Seneca Avenue to the north, and Lake Ontario to the east in the City of Mississauga.

2.0 PURPOSE AND SCOPE OF STUDY

The purpose of this desktop hydrogeological investigation is to develop a preliminary understanding baseline of groundwater conditions and to identify, at the earliest stages of the process, potential impacts and develop mitigation measures to address these potential impacts.

The scope of work for the Background Hydrogeological Report is as follows:

- Desktop review of available published information sources to characterize the hydrogeological conditions at the site and vicinity, including geological and topographic mapping, aerial photography, the Ministry of Environment, Conservation and Parks (MECP) Water Well Record database, and any site-specific reports provided to WSP.
- Preliminary identification of potential impacts and mitigation measures.

3.0 BACKGROUND INFORMATION AND AVAILABLE DATA

For the purpose of this desktop study, information about the subsurface conditions at the study area was obtained from the following sources:

- Chapman, L.J., and Putnam, D.F., 2007, *"The Physiography of Southern Ontario"*; Ontario Geological Survey.
- Ontario Geological Survey 2010, "*Surficial Geology of Southern Ontario; Ontario Geological Survey, Miscellaneous Release – Data 128 – Revised*".
- Golder Associates Ltd., December 18, 2015. "Geotechnical and Hydrogeological Investigation, Proposed Sanitary Sewer Replacement Various Streets in Mississauga". Project 15-2300, Mississauga, Ontario (Golder 2015).

4.0 DESCRIPTION OF HYDROGEOLOGIC SETTING

4.1 Physiography, Topography, and Drainage

The project area is located within the Iroquois Plain physiographic region, as delineated in The Physiography of Southern Ontario (Chapman and Putman 1984). The glacial Iroquois Plain stretches along the northern shoreline of Lake Ontario, extending from the Niagara Escarpment in the west to the Scarborough Bluffs in the east, and

the shallow soil conditions consist of glaciolacustrine sediments deposited in Lake Iroquois. These sediments primarily consist of sand, silt, and gravel, with a shallow cover of glacial till remaining over the bedrock.

The bedrock underlying the Greater Toronto Area consists of three shale dominated units: from oldest to youngest, they are the Blue Mountain, Georgian Bay, and Queenston Formations (OGS 1991). These bedrock formations are essentially horizontally bedded, although on a regional scale, they dip gently to the south. The Georgian Bay Formation which underlies the study area consists mainly of blue-grey shale, containing siltstone, sandstone, and limestone interbeds. Although regional geology mapping indicates that the site is underlain by the Georgian Bay Formation, the site is located near the boundary with the Queenston Formation and some areas of the site may be underlain by the Queenston Formation. The shale of the Queenston formation generally contains limestone, dolostone, and siltstone interbeds.

Based on the surficial geology mapping, the near surface soils within the study area consist of interbedded flow till, rainout deposits and silt and clay covering the northeastern portion of the study area as shown on Figure 3. The central and southern portion of the study area consist of overlapping foreshore basinal and modern alluvial deposits. Foreshore basinal (lacustrine) deposits consist of sand, gravel, and minor silt and clay while modern alluvial deposits consist of clay, silt, sand and gravel, based on Chapman and Putnam (1984).

The lacustrine sediments (primarily sand deposits) have the potential to yield groundwater. Modern alluvium is mapped along the Credit River, which generally follows a buried bedrock valley to Lake Ontario, and groundwater discharge is expected within the coarser stream deposits (Davies and Holysh 2007). The underlying Georgian Bay Formation is considered to be an aquitard (Davies and Holysh 2007; Singer, Cheng, and Scafe 2003). The inferred direction of groundwater flow through the project area is to the east and southeast.

4.2 Regional Hydrogeology

Based on the Credit River Watershed and Region of Peel Natural Areas Inventory (NAI) Report dated October 2011, the study area lies within the Lower Credit River Watershed. There are two regionally significant groundwater aquifers within the Credit River Watershed. The Guelph/Amabel Formation found west of the Niagara Escarpment and buried bedrock valleys consisting of coarse-grained glacial overburden deposits, found throughout the watershed (Credit Valley Conservation 2007b, 2008). Some of these buried valleys are known to contain large volumes of groundwater, including aquifers in Peel Regions (Credit Valley Conservation 2007b), that municipalities tap to supply municipal water. However, no groundwater supply aquifers are present within the study area.

Based on the Regional Groundwater Mapping Study (CLOCA 2004) and surficial geology mapping (Ontario Geological Survey 2010), the study area is underlain by thin surficial deposits that lie on top of Halton Aquitard (Halton Till) deposits of varying thickness. Halton Till deposits pinches out moving closer to the Lake Ontario shoreline. Below the Halton Till or thin recent surficial deposits lie bedrock (Georgian Bay Formation).

Precipitation falling across the area contributes to recharge of the overburden and bedrock aquifer systems although the generally low permeability of the soils limits infiltration rates. The majority of groundwater recharge within the study area is expected through the surface water creeks in the southwest and conservation reserve or wooded area which migrate laterally and discharge southeastward to Lake Ontario. A small component of the recharge will migrate to recharge deeper regional overburden and bedrock units. However, away from the Credit River located along the western boundary of the study area, the remainder of the site is generally inferred to be areas of nominal groundwater recharge. Given the predominance of fine textured glacial till soils in the area, the quantity of local recharge and subsequent base flow contributions to Credit River are inferred to be negligible. The

proximity to Lake Ontario limits the contribution of groundwater recharge to baseflow to the Credit River system and wetland features.

Areas of groundwater discharge were generally inferred to be located in the vicinity of Credit River in the southwest. Based on the on-line mapping available from the Ontario Ministry of Natural Resources and Forestry (MNRF) Ontario GeoHub (https://geohub.lio.gov.on.ca/), no other watercourses are located in the vicinity of the study area aside from the adjacent Credit River and two Creeks in the southwest.

Regional groundwater flow direction is primarily towards Lake Ontario although more variable flow directions may occur within the shallow overburden where groundwater flow is likely to be toward the Credit River and elsewhere where local groundwater flow directions may be influenced by small watercourses and anthropogenic features.

4.3 Groundwater Resources and Conditions

Based on a review and plot of the MECP well records, water well records were identified within the study area (including a 500 m buffer around the study area). A tabular summary of the well records in the vicinity of the study area is presented in Appendix B following the text of this report. The area is provided with full municipal services and groundwater is not expected to be used for potable water supply.

A summary of the well record information within 500 m of the study area is presented below in Table 1.

Table 1: Water Well Record Summary (500 m radius)

Well Record Information	Number of Wells
Total Recorded Wells1	300
Drilling Method	
Bored/Dug/Driven	121
Cable Tool, Rotary Drilling	33
Other/Not Specified	122
Use	
Public Supply	0
Municipal Supply	1
Domestic Supply	0
Commercial	0
Industrial	0
Agricultural (Irrigation, Stock)	0
Monitoring Wells	184
Not Used/Abandoned	25
Dewatering	1
Test hole	16
Not Specified	73
Data	
Total Recorded Wells1	300
Depth <10 m	158
Depth >10 m and <30 m	43
Depth >30 m	4

Well Record Information	Number of Wells
Depth Not Specified	95
Bedrock Aquifer	52
Overburden Aquifer	144
Static water Level <= 4 mbgs[2]	7
Flowing Wells	0
High Volume Well >100 L/min Test Rate	0

Notes:

1. It is common for shallow dug wells and well points to be not recorded.
2. m bgs = meters below ground surface.

Based on the well record information (Table B-1, Appendix B), two primary aquifers are inferred to be present in the area of the Site: i) shallow unconfined or partly confined aquifer, or aquifers and; ii) the deep bedrock aquifer. Based on the well record information, approximate depth to bedrock is in the range of 7.0 to 14.9 m below ground surface (bgs). The area is municipally serviced, and private or domestic water wells are not found in the well records. Most of the wells found in the well records are monitoring wells constructed between 1994 to 2020.

Based on MECP permits to take water records within the study area (Table B-2, Appendix B), 16 permits were issued for construction dewatering activities and groundwater remediation, one is active now. Two permits were issued for surface water taking from Credit River. No Environmental Activity and Sector Registry (EASR) record was found within the study area.

5.0 POTENTIAL IMPACTS

Based on the hydrogeological setting and groundwater conditions for the study area as described in Section 4.2, the Site is located in areas with shallow groundwater levels, with groundwater level in the range of approximately 1.2 m bgs to 1.7 m bgs, based on MECP well records. The shallow groundwater levels beneath the study area appear to be controlled by overburden sand, silt and gravel units which are unconfined aquifers generally encountered at elevations ranging from approximately 75.9 m above sea level (asl) to 81.1 m asl.

Based on the above information, excavations to a depth of more than 2 m bgs at the study area are expected to encounter groundwater. As part of the Geotechnical Investigation conducted in the vicinity of the study area by Golder (Golder 2015), the reported hydraulic conductivity calculated by using Hazen method for encountered silty and sandy soils ranged from of 3.6×10^{-7} to 1.0×10^{-5} m/s. The hydraulic conductivity of the silty and sandy soils of the overburden could allow for substantial groundwater inflow to an excavation, which contacts the aquifer materials. Under this assumption, excavations to a depth of >1 to 2 m bgs may encounter groundwater inflow and dewatering of the aquifer below the excavation will be required to ensure excavation stability. For permanent installation of services or foundations that are below the water table proper precautions should be taken to avoid uplift, groundwater channelization or instability. If foundation drainage systems (active or passive) are proposed, the potential groundwater quantities diverted through them should be assessed.

There are two surface water features (Kenollie Creek and Mary Fix Creek) in the study area. Moreover, the Credit River and Lake Ontario border the study area, and the Credit Valley Conservation (CVC) regulation limits around these waterbodies overlap the study area (Figure 2). Any development proposed within these features, or their regulation limits will require authorization or a permit from the CVC.

According to Credit Valley-Toronto and Region-Central Lake Ontario (CTC) Source Protection Plan, portions of the study area lie within Lorne Park and Lakeview Intake Protection Zones 2 (IPZ-2) with a vulnerability score of 4.5.

No domestic groundwater wells were identified within the study area. The area is provided with full municipal services and groundwater is not expected to be used for potable water supply and therefore no impacts to groundwater users are expected.

Due to the specific hydrogeological setting of the study areas, detailed site-specific and development specific hydrogeological investigations must be carried out to sufficient depths that explore the relationship between the proposed development and local groundwater and soil conditions. In particular, the impact of groundwater and potential proximity of the silt, sand and gravel aquifers must be addressed to ensure that the development does not result in temporary (i.e., construction) or long-term unstable conditions due the proposed earthworks or built structures.

Should the proposed development require temporary or permanent dewatering and/or groundwater or surface water diversion, the site-specific investigations will need to assess the impacts of the dewatering and/or diversion on the local natural and built environments. The investigations should include a determination of baseline, pre-construction conditions and provide proposed mitigation strategies to address potential impacts. These investigations should also address what permitting may be required both for the water taking and for the water disposal/discharge. For construction dewatering projects, the MECP requires that water takings greater than 50 m^3/day and less than 400 m^3/day be registered online through the Environmental Activity and Sector Registry (EASR) system. For construction dewatering of more than 400 m^3/day and for long-term discharges of more than 50 m^3/day, a Permit to Take Water (PTTW) from the MECP is required. Depending on the receptors, water disposal/discharge may require permitting from the appropriate agencies.

6.0 LIMITATIONS

This report has been prepared for the exclusive use of GMBP and the Region for specific application the Project and the Class EA investigations of alternative water and wastewater strategies for the Rosemere, Hiawatha, and Elmwood sewage pumping station (SPS) servicing areas and investigate alternative routes for the future Lakeshore sub-transmission watermain east of the credit river, in Mississauga, Ontario. The findings presented in this report were prepared in accordance with generally accepted hydrogeological practice at the time of this study. It is stressed that the information in this report is provided for planning purposes only. This report is not intended for preliminary or detailed design or construction purposes.

The professional services addressed in this report include only the hydrogeological aspects of the subsurface conditions at these sites. The presence or implication(s) of possible surface and/or subsurface contamination resulting from previous activities or uses of the site and/or resulting from the introduction onto the site of materials from off-site sources are outside the scope of this desktop study and have not been addressed.

7.0 CLOSURE

This report is intended to summarise available data on subsurface soil and groundwater conditions for the Study Areas as identified on the Key Plan, Figure 1, attached. The data contained in this report was obtained from published geological studies, maps, and existing subsurface investigation report by Golder (Golder 2015).

We trust this report provides sufficient information for your requirements. If you have any questions regarding the contents of this report or require additional information, please do not hesitate to contact this office.

APPENDIX A

Important Information and Limitations of This Report

IMPORTANT INFORMATION AND LIMITATIONS OF THIS REPORT

Standard of Care: WSP Canada Inc., (WSP) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty, expressed or implied is made.

Basis and Use of the Report: This report has been prepared for the specific site, design objective, development and purpose described to WSP by the Client. The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location. Any change of site conditions, purpose, development plans or if the project is not initiated within eighteen months of the date of the report may alter the validity of the report. WSP cannot be responsible for use of this report, or portions thereof, unless WSP is requested to review and, if necessary, revise the report.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without WSP's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, WSP may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to WSP. The report, all plans, data, drawings and other documents as well as all electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of WSP. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client cannot rely upon the electronic media versions of WSP's report or other work products.

The report is of a summary nature and is not intended to stand alone without reference to the instructions given to WSP by the Client, communications between WSP and the Client, and to any other reports prepared by WSP for the Client relative to the specific site described in the report. In order to properly understand the suggestions, recommendations and opinions expressed in this report, reference must be made to the whole of the report. WSP cannot be responsible for use of portions of the report without reference to the entire report.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project. The extent and detail of investigations, including the number of test holes, necessary to determine all of the relevant conditions which may affect construction costs would normally be greater than has been carried out for design purposes. Contractors bidding on, or undertaking the work, should rely on their own investigations, as well as their own interpretations of the factual data presented in the report, as to how subsurface conditions may affect their work, including but not limited to proposed construction techniques, schedule, safety and equipment capabilities.

Soil, Rock and Groundwater Conditions: Classification and identification of soils, rocks, and geologic units have been based on commonly accepted methods employed in the practice of geotechnical engineering and related disciplines. Classification and identification of the type and condition of these materials or units involves judgment, and boundaries between different soil, rock or geologic types or units may be transitional rather than abrupt. Accordingly, WSP does not warrant or guarantee the exactness of the descriptions.

Special risks occur whenever engineering or related disciplines are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain subsurface conditions. The environmental, geologic, geotechnical, geochemical and hydrogeologic conditions that WSP interprets to exist between and beyond sampling points may differ from those that actually exist. In addition to soil variability, fill of variable physical and chemical composition can be present over portions of the site or on adjacent properties. **The professional services retained for this project include only the geotechnical aspects of the subsurface conditions at the site, unless otherwise specifically stated and identified in the report.** The presence or implication(s) of possible surface and/or subsurface contamination resulting from previous activities or uses of the site and/or resulting from the introduction onto the site of materials from off-site sources are outside the terms of reference for this project and have not been investigated or addressed.

Soil and groundwater conditions shown in the factual data and described in the report are the observed conditions at the time of their determination or measurement. Unless otherwise noted, those conditions form the basis of the recommendations in the report. Groundwater conditions may vary between and beyond reported locations and can be affected by annual, seasonal and meteorological conditions. The condition of the soil, rock and groundwater may be significantly altered by construction activities (traffic, excavation, groundwater level lowering, pile driving, blasting, etc.) on the site or on adjacent sites. Excavation may expose the soils to changes due to wetting, drying or frost. Unless otherwise indicated the soil must be protected from these changes during construction.

Sample Disposal: WSP will dispose of all uncontaminated soil and/or rock samples 90 days following issue of this report or, upon written request of the Client, will store uncontaminated samples and materials at the Client's expense. In the event that actual contaminated soils, fills or groundwater are encountered or are inferred to be present, all contaminated samples shall remain the property and responsibility of the Client for proper disposal.

Follow-Up and Construction Services: All details of the design were not known at the time of submission of WSP's report. WSP should be retained to review the final design, project plans and documents prior to construction, to confirm that they are consistent with the intent of WSP's report.

During construction, WSP should be retained to perform sufficient and timely observations of encountered conditions to confirm and document that the subsurface conditions do not materially differ from those interpreted conditions considered in the preparation of WSP's report and to confirm and document that construction activities do not adversely affect the suggestions, recommendations and opinions contained in WSP's report. Adequate field review, observation and testing during construction are necessary for WSP to be able to provide letters of assurance, in accordance with the requirements of many regulatory authorities. In cases where this recommendation is not followed, WSP's responsibility is limited to interpreting accurately the information encountered at the borehole locations, at the time of their initial determination or measurement during the preparation of the Report.

Changed Conditions and Drainage: Where conditions encountered at the site differ significantly from those anticipated in this report, either due to natural variability of subsurface conditions or construction activities, it is a condition of this report that WSP be notified of any changes and be provided with an opportunity to review or revise the recommendations within this report. Recognition of changed soil and rock conditions requires experience and it is recommended that WSP be employed to visit the site with sufficient frequency to detect if conditions have changed significantly.

Drainage of subsurface water is commonly required either for temporary or permanent installations for the project. Improper design or construction of drainage or dewatering can have serious consequences. WSP takes no responsibility for the effects of drainage unless specifically involved in the detailed design and construction monitoring of the system.

RE: Entry into the Ontario Public Register of Archaeological Reports: Archaeological Assessment Report Entitled, "Stage 1 Archaeological Assessment Port Credit East Wastewater Servicing Optimization Strategy Schedule 'C' Environmental Assessment, Part of Lots A, 4, 5, and 6, Range 1 Credit River I.R., Lot C, Broken Front Concession, and Port Credit Town Plot, Township of Toronto, Peel County, now the City of Mississauga, Municipality of Peel", Dated Aug 14, 2023, Filed with MCM Toronto Office on N/A, MCM Project Information Form Number P468-0081-2021, MCM File Number 0012043

Dear Ms. Fisher:

The above-mentioned report, which has been submitted to this ministry as a condition of licensing in accordance with Part VI of the *Ontario Heritage Act*, R.S.O. 1990, c 0.18, has been entered into the Ontario Public Register of Archaeological Reports without technical review.[1]

Please note that the ministry makes no representation or warranty as to the completeness, accuracy or quality of reports in the register.

Should you require further information, please do not hesitate to send your inquiry to Archaeology@Ontario.ca

cc. Archaeology Licensing Officer

Executive Summary

The Executive Summary highlights key points from the report only; for complete information and findings, as well as the limitations, the reader should examine the complete report.

WSP Canada Inc. (WSP) was retained by GM BluePlan Engineering Limited (GM BluePlan) to conduct a Stage 1 Archaeological Assessment as part of a Schedule 'C' Municipal Class Environmental Assessment (EA) for the proposed Port Credit East Water and Wastewater Servicing Optimization Strategy (the Project).

Golder Associates Ltd. (Golder), now WSP Canada Inc., previously completed a Stage 1 Archaeological Assessment for the Project (Project Information Numbers [PIF] P468-0049-2020 & P468-0050-2020) which assessed the archaeological potential of an area which included the right-of-ways (ROW) of roads as well as the locations of the Rosemere, Elmwood, and Hiawatha sewage pumping stations (SPS) (Golder 2021). Following the Stage 1 Archaeological Assessment, GM BluePlan identified seven additional areas requiring Stage 1 Archaeological Assessment within the greater Project Area. These seven distinctive areas constitute the Study Area for this Stage 1 Archaeological Assessment, which is intended to supplement Golder's previous Stage 1 Archaeological Assessment. The Study Area is generally limited by Front Street in the south, Vernoca Drive and just east of Forest Avenue in the west, just south of Seneca Avenue to the north, and Lake Ontario to the east in the City of Mississauga (Maps 1 and 2). Study Area 1 is located within Lot C, Broken Front Concession and Port Credit Town Plot, within Tall Oaks Park. Study Area 2 is located at the intersection of Lakeshore Road and Elmwood Avenue North within Lot A, Range 1 Credit River I.R. Study Area 3 is located adjacent to the Port Credit Marine Harbour within Port Credit Town Plot. Study Area 4 is located adjacent to the Rosemere SPS and is within Lot 5 and 6, Range 1 Credit River I.R. Study Area 5 is located within the Harold E. Kennedy Park along Rosewood Avenue and is located within Lot A, Broken Front Concession and Port Credit Town Plot. Study Area 6 is located south of Mona Road and is located within Lot 4, Range 1 Credit River I.R. Study Area 7 is located at the corner of Front Street North and Lakeshore Road East. These seven distinctive areas encompass an area approximately 1.4 ha in size.

The objectives of the Stage 1 Archaeological Assessment were to compile available information about the known and potential cultural heritage resources within the Study Area and to provide specific direction for the protection, management and/or recovery of these resources. The Stage 1 Archaeological Assessment included a review of historical maps and aerial photographs, as well as relevant archaeological, historical, and environmental documentation. The Ministry of Citizenship and Multiculturalism (MCM) archaeological sites database was queried on October 13, 2021. Seventeen registered archaeological sites were identified within a 1 km radius of the overall Study Area, two of which are located within 300 m of Study Area 3 and two of which are located within 300 m of Study Area 4.

A site inspection was conducted on October 20, 2021, July 27, 2022, and May 2, 2023. Site inspections occurred over multiple years as the project area expanded. The archaeological potential of the Study Area was assessed based on the presence of features indicating archaeological potential as outlined in Section 1.3.1 of the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011). Features indicating archaeological potential include proximity to previously identified archaeological sites, water sources, early transportation routes, early Euro-Canadian habitation as well as the presence of elevated topography, pockets of well-drained sandy soil, and distinctive land formations or resource areas. Based on the background information gathered for this Stage 1 Archaeological Assessment, it was determined that portions of the Study Area have archaeological potential due to their proximity to the early historic Euro-Canadian settlement of Port Credit, early historic Euro-Canadian transportation routes, water sources including Lake Ontario, the Credit River and other tributaries, and registered archaeological sites.

The Stage 1 Archaeological Assessment and property inspections found that portions of the Study Area exhibited potential for the recovery of pre- and post-contact Indigenous and Euro-Canadian historical archaeological resources. Based on the findings of the Stage 1 Archaeological Assessment, the following recommendations are made, as illustrated in Map 9.

1) Lands that have been previously subjected to Archaeological Assessment(s) and cleared by the MCM of further archaeological concern are recommended to be exempt from further Archaeological Assessment.

    a) The portion of Study Area 4 that consists of the Rosemere SPS was previously assessed and no further assessment was recommended for that area (ASI 2017; Map 9D).

    b) Study Area 7 has been previously assessed and no further assessment was recommended for that area (WSP 2018; Map 9G).

2) The Stage 1 Archaeological Assessment has determined there is potential for the identification of archaeological resources within portions of the Study Area:

    a) Study Area 1; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9A).

    b) Study Area 4; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9D).

    c) Study Area 6; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9F).

    Stage 2 test pit survey at 5 m intervals is recommended for these areas prior to ground disturbance activities in accordance with Section 2.1.2 of the MCM's *Standards and Guidelines for Consultant Archaeologists* (2011). Test pits should be 30 cm in diameter and hand excavated 5 cm into sterile subsoil. If artifacts are recovered their location should be recorded with a GPS unit and test pit intervals reduced to 2.5 m within 5 m of the positive test pit, as well as a 1 m test unit if necessary.

3) Areas of previous disturbance were identified in portions of the Study Area. These areas of disturbance include parking lots, sidewalks/paved public spaces, and landscape design areas (i.e. gardens, grass boulevards) or past disturbance documented in historical aerial photographs. The Stage 1 Archaeological Assessment property inspection determined there is low potential for the identification of archaeological resources in portions of the Study Area:

    a) Study Area 1; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9A).

    b) Study Area 2; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9B).

    c) Study Area 3; Low archaeological potential within Study Area; no further Archaeological Assessment is recommended (Map 9C).

    d) Study Area 4; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9D).

    e) Study Area 5; Low archaeological potential within the entire Study Area; no further Archaeological Assessment is recommended for these areas (Map 9E).

Despite efforts and due diligence, no Archaeological Assessment can necessarily account for potential archaeological resources. Should deeply buried archaeological resources be identified during ground disturbance activity associated with future development of the Study Area, ground disturbance activities shall be immediately halted, and the Archaeology Division of the Culture Programs Unit of the MCM notified.

The MCM is requested to review, and provide a letter indicating their satisfaction with the results and recommendations presented herein, with regard to the 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licences, and to enter this report into the Ontario Public Register of Archaeological Reports.

Study Limitations

WSP Canada Inc. (WSP) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the archaeological profession currently practicing under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty expressed or implied is made.

This report has been prepared for the specific site, design objective, developments and purpose described to WSP by GM BluePlan Engineering Limited (the Client). The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without WSP's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, WSP may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to WSP. The report, all plans, data, drawings and other documents as well as all electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of WSP. The Client acknowledges the electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client cannot rely upon the electronic media versions of WSP's report or other work products.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project.

Special risks occur whenever archaeological investigations are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain archaeological resources. The sampling strategies incorporated in this study comply with those identified in the MCM's *Standards and Guidelines for Consultant Archaeologists* (2011).

Project Personnel

Project Director	Heather Melcher, MSc, Director of Ecology, Ontario Earth and Environment
Project Manager	Kalena Lair, Environmental Assessment Specialist
Licensee	Rhiannon Fisher, MSc, RPA (P468), Lead Archaeologist
Report Preparation	Martha Tildesley, MA, RPA (P399), Archaeologist Randy Hahn, PhD (P1107), Archaeologist
Site Inspection	Martha Tildesley
Technical Review	Rhiannon Fisher
Senior Review	Jamie Lemon, MA, (P1056), Senior Archaeologist, Rhiannon Fisher

1.0 PROJECT CONTEXT

1.1 Development Context

WSP Canada Inc. was retained by GM BluePlan Engineering Limited (GM BluePlan) to conduct a Stage 1 Archaeological Assessment as part of a Schedule 'C' Municipal Class Environmental Assessment (EA) for the proposed Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Class EA (the Project).

Golder Associates Ltd. (Golder), now WSP Canada Inc., previously completed a Stage 1 Archaeological Assessment for the Project (Project Information Number [PIF] P468-0049-2020 & P468-0050-2020) which assessed the archaeological potential of an area which included the right-of-ways (ROW) of roads as well as the locations of the Rosemere, Elmwood, and Hiawatha pumping stations (SPS). Following the Stage 1 Archaeological Assessment, GM BluePlan identified seven additional areas requiring Stage 1 Archaeological Assessment within the greater Project Area. These seven distinctive areas constitute the Study Area for this Stage 1 Archaeological Assessment, which is intended to supplement Golder's previous Stage 1 Archaeological Assessment. The Study Area is generally limited by Front Street in the south, Vernoca Drive and just east of Forest Avenue in the west, just south of Seneca Avenue to the north, and Lake Ontario to the east in the City of Mississauga (Maps 1 and 2). Study Area 1 is located within Lot C, Broken Front Concession and Port Credit Town Plot, within Tall Oaks Park. Study Area 2 is located at the intersection of Lakeshore Road and Elmwood Avenue North within Lot A, Range 1 Credit River I.R. Study Area 3 is located adjacent to the Port Credit Marine Harbour within Port Credit Town Plot. Study Area 4 is located adjacent to the Rosemere SPS and is within Lot 5 and 6, Range 1 Credit River I.R. Study Area 5 is located within the Harold E. Kennedy Park along Rosewood Avenue and is located within Lot A, Broken Front Concession and Port Credit Town Plot. Study Area 6 is located south of Mona Road and is located within Lot 4, Range 1 Credit River I.R. Study Area 7 is located at the corner of Front Street North and Lakeshore Road East. These seven distinctive areas encompass an area approximately 1.4 ha in size.

The Study Area consists of public spaces, so no permission was required to enter the Study Area.

1.1.1 Objectives

The objectives of the Stage 1 Archaeological Assessment were to compile available information about the known and potential cultural heritage resources within the Study Area and to provide specific direction for the protection, management and/or recovery of these resources. In compliance with the Provincial standards and guidelines set out in the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011), the objectives of the Stage 1 Archaeological Assessment were:

- to provide information about the Study Area's geography, history, previous archaeological fieldwork and current land condition
- to evaluate in detail the Study Area's archaeological potential, which will support recommendations for Stage 2 survey for all or parts of the Study Area
- to recommend appropriate strategies for Stage 2 archaeological survey

To meet these objectives WSP archaeologists employed the following research strategies:

- review of relevant archaeological, historic, and environmental literature pertaining to the Study Area
- review of an updated listing of registered archaeological sites from the Ontario Archaeological Sites Database (OASD)

- review of previously completed Archaeological Assessments within or adjacent to the Study Area
- review of historical maps of the Study Area
- a property inspection

1.2 Historic Context

1.2.1 Regional Indigenous Pre-Contact History

The general culture history of southern Ontario based on Ellis and Ferris (1990), spanning the Pre-Contact Indigenous Period is summarised in Table 1.

Table 1: Overview of Cultural Chronology of Southern Ontario

Period		Time Period (circa)	Characteristics
Paleo	Early	10,950 – 10,350 BP	Gainey, Barnes and Crowfield traditions; Small bands; mobile hunters and gatherers and large territories; Fluted projectiles.
	Late	10,350 – 9950 BP	Holcomb, Hi-Lo and Lanceolate biface traditions; continuing mobility; Campsite/Way-Station sites; Smaller territories are utilized; Non-fluted projectiles.
Archaic	Early	9950 – 7950 BP	Side-notched, corner-notched, and bifurcate base traditions; growing diversity of stone tool types; heavy woodworking tools appear (e.g., ground stone axes and chisels).
	Middle	7950 – 4450 BP	Stemmed, Brewerton side- and corner-notched traditions; reliance on local resources; populations increasing; more ritual activities; fully ground and polished tools; netsinkers common; earliest copper tools.
	Late	4450 – 2900 BP	Narrow Point, Broad Point and Small Point traditions; less mobility; use of fish-weirs; more formal cemeteries appear; stone pipes emerge; long-distance trade.
Woodland	Early	2900 – 2350 BP	Meadowood tradition; cord-roughened ceramics emerge; Meadowood cache blades and side-notched points; bands of up to 35 people.
	Middle	2350 – 1400 BP	Saugeen, Point Peninsula and Couture traditions; stamped ceramics appear; Saugeen projectile points; cobble spall scrapers; seasonal settlements and resource utilization; post holes, hearths, middens, cemeteries, and rectangular structures identified.
	Transitional	1400 – 1050 BP	Princess Point tradition; cord roughening, impressed lines, and punctate designs on pottery; adoption of maize horticulture at the western end of Lake Ontario; oval houses and ‘incipient’ longhouses; first palisades; villages with up to 75 people.
	Early Late Woodland	1050 – 650 BP	Glen Meyer tradition; settled village-life based on agriculture; small villages (0.4 ha) with up to 75-200 people and 4-5 longhouses; semi-permanent settlements.
	Middle Late Woodland	650 – 550 BP	Uren and Middleport traditions; classic longhouses emerge; larger villages (1.2 ha) with up to 600 people; more permanent settlements (30 years).
	Late Woodland	550 – 350 BP	Larger villages (1.7 ha) with examples up to 5 ha and up to 2,500 people; extensive croplands; hamlets, cabins, camps, and cemeteries; potential tribal units; fur trade begins ca. 1580; European trade goods appear.

*(BP) Before Present Era dates are calculated using the year 1950 as the recognized start date of the present era.

Paleo Period

The first human occupation of southern Ontario begins just after the end of the Wisconsin Glacial Period. Although there were a complex series of ice retreats and advances which played a large role in shaping the local topography, south-central Ontario was finally ice free by 12,500 years ago.

The first human settlement can be traced back 11,000 years, when this area was settled by Indigenous groups that had been living south of the Great Lakes. The period of these early Indigenous inhabitants is known as the Paleo Period (Ellis and Deller 1990).

Our current understanding of settlement patterns of Early Paleo peoples suggests that small bands, consisting of probably no more than 25-35 individuals, followed a pattern of seasonal mobility extending over large territories. One of the most thoroughly studied of these groups followed a seasonal round that extended from as far south as Chatham to the Horseshoe Valley north of Barrie. Early Paleo sites tend to be located in elevated locations on well-drained loamy soils. Many of the known sites were located on former beach ridges associated with glacial lakes. There are a few extremely large Early Paleo sites, such as one located close to Parkhill, Ontario, which covered as much as six hectares. It appears that these sites were formed when the same general locations were occupied for short periods of time over the course of many years. Given their placement in locations conducive to the interception of migratory mammals such as caribou, it has been suggested that they may represent communal hunting camps. There are also smaller Early Paleo camps scattered throughout the interior of southwestern and south-central Ontario, usually situated adjacent to wetlands.

Research suggests that population densities were very low during the Early Paleo Period (Ellis and Deller 1990: 54). Archaeological examples of Early Paleo sites are rare.

The Late Paleo Period (10,350 – 9950 BP) has been less well researched and is consequently more poorly understood. By this time the environment of south-central Ontario was coming to be dominated by closed coniferous forests with some minor deciduous elements. It seems that many of the large game species that had been hunted in the early part of the Paleo Period had either moved further north, or as in the case of the mastodons and mammoths, became extinct.

Like the Early Paleo peoples, Late Paleo peoples covered large territories as they moved about in response to seasonal resource fluctuations. On a province wide basis Late Paleo projectile points are far more common than Early Paleo materials, suggesting a relative increase in population.

The end of the Late Paleo Period was heralded by numerous technological and cultural innovations that appeared throughout the Archaic Period. These innovations may be best explained in relation to the dynamic nature of the post-glacial environment and region-wide population increases.

Archaic Period

During the Early Archaic Period (9950 – 7950 BP), the jack and red pine forests that characterized the Late Paleo environment were replaced by forests dominated by white pine with some associated deciduous trees (Ellis et al.1990: 68-69). One of the more notable changes in the Early Archaic Period is the appearance of side and corner-notched projectile points. Other significant innovations include the introduction of ground stone tools such as celts and axes, suggesting the beginnings of a simple woodworking industry. The presence of these often large and not easily portable tools suggests there may have been some reduction in the degree of seasonal movement, although it is still suspected that population densities were quite low, and band territories large.

During the Middle Archaic Period (7950 – 4450 BP) the trend to more diverse toolkits continued, as the presence of net-sinkers suggest that fishing was becoming an important aspect of the subsistence economy. It was also at this time that "bannerstones" were first manufactured.

Bannerstones are carefully crafted ground stone devices that served as a counterbalance for atlatls or spear-throwers. Another characteristic of the Middle Archaic is an increased reliance on local, often poor-quality chert resources for the manufacturing of projectile points. It seems that during earlier periods, when groups occupied large territories, it was possible for them to visit a primary outcrop of high-quality chert at least once during their seasonal round. However, during the Middle Archaic, groups inhabited smaller territories that often did not encompass a source of high-quality raw material. In these instances, lower quality materials which had been deposited by the glaciers in the local till and river gravels were utilized.

This reduction in territory size was probably the result of gradual region-wide population growth which led to the infilling of the landscape. This process forced a reorganization of Indigenous subsistence practices, as more people had to be supported from the resources of a smaller area. During the latter part of the Middle Archaic, technological innovations such as fish weirs have been documented as well as stone tools especially designed for the preparation of wild plant foods.

It is also during the latter part of the Middle Archaic Period that long-distance trade routes began to develop, spanning the northeastern part of the continent. In particular, native copper tools manufactured from a source located northwest of Lake Superior were being widely traded (Ellis et al.1990: 66). By 5450 BP the local environment had stabilized in a near modern form (Ellis et al. 1990: 69).

During the Late Archaic (4450 – 2900 BP) the trend towards decreased territory size and a broadening subsistence base continued. Late Archaic sites are far more numerous than either Early or Middle Archaic sites, and it seems that the local population had definitely expanded. It is during the Late Archaic that the first formal cemeteries appear. Before this time individuals were interred close to the location where they died. During the Late Archaic, if an individual died while his or her group happened to be at some distance from their group cemetery, the bones would be kept until they could be placed in the cemetery. Consequently, it is not unusual to find disarticulated skeletons, or even skeletons lacking minor elements such as fingers, toes or ribs, in Late Archaic burial pits.

The appearance of formal cemeteries during the Late Archaic has been interpreted as a response to increased population densities and competition between local groups for access to resources. It is argued that cemeteries would have provided strong symbolic claims over a local territory and its resources. These cemeteries are often located on heights of well-drained sandy/gravel soils adjacent to major watercourses.

This suggestion of increased territoriality is also consistent with the regionalized variation present in Late Archaic projectile point styles. It was during the Late Archaic that distinct local styles of projectile points appear. Also, during the Late Archaic the trade networks which had been established during the Middle Archaic continued to flourish. Native copper from northern Ontario and marine shell artifacts from as far away as the Mid-Atlantic coast are frequently encountered as grave goods. Other artifacts such as polished stone pipes and banded slate gorgets also appear on Late Archaic sites. One of the more unusual and interesting of the Late Archaic artifacts is the birdstone. Birdstones are small, bird-like effigies usually manufactured from green banded slate.

Woodland Period

The Early Woodland Period (2900 – 2350 BP) is distinguished from the Late Archaic Period primarily by the addition of ceramic technology. While the introduction of pottery provides a useful demarcation point for archaeologists, it may have made less difference in the lives of the Early Woodland peoples. The first pots were thick walled and friable. It has been suggested that they were used in the processing of nut oils by boiling crushed nut fragments in water and skimming off the oil. These vessels were not easily portable, and individual pots must not have enjoyed a long use life. There have also been numerous Early Woodland sites located at which no pottery was found, suggesting that ceramic vessels had yet to assume a central position in the day-to-day lives of Early Woodland peoples.

Other than the introduction of this limited ceramic technology, the lifeways of Early Woodland peoples show a great deal of continuity with the preceding Late Archaic Period. For instance, birdstones continue to be manufactured, although the Early Woodland varieties have "pop-eyes" which protrude from the sides of their heads.

Likewise, the thin, well-made projectile points which were produced during the terminal part of the Archaic Period continue in use. However, the Early Woodland variants were side-notched rather than corner-notched, giving them a slightly altered and distinctive appearance.

The trade networks which were established in the Middle and Late Archaic also continued to function, although there does not appear to have been as much traffic in marine shell during the Early Woodland Period. During the last 200 years of the Early Woodland Period, projectile points manufactured from high quality raw materials from the American Midwest begin to appear on sites in southwestern Ontario.

In terms of settlement and subsistence patterns, the Middle Woodland (2350 – 1400 BP) provides a major point of departure from the Archaic and Early Woodland Periods. While Middle Woodland peoples still relied on hunting and gathering to meet their subsistence requirements, fish were becoming an even more important part of the diet.

In addition, Middle Woodland peoples relied much more extensively on ceramic technology. Middle Woodland vessels are often heavily decorated with hastily impressed designs covering the entire exterior surface and upper portion of the vessel interior. Consequently, even very small fragments of Middle Woodland vessels are easily identifiable.

It is also at the beginning of the Middle Woodland Period that rich, densely occupied sites appear along the margins of major rivers and lakes. While these areas had been utilized by earlier peoples, Middle Woodland sites are significantly different in that the same location was occupied off and on for as long as several hundred years and large deposits of artifacts often accumulated. Unlike earlier seasonally utilized locations, these Middle Woodland sites appear to have functioned as base camps, occupied off and on over the course of the year. There are also numerous small upland Middle Woodland sites, many of which can be interpreted as special purpose camps from which localized resource patches were exploited. This shift towards a greater degree of sedentism continues the trend witnessed from at least Middle Archaic times and provides a prelude to the developments that follow during the Late Woodland Period.

The Late Woodland Period began with a shift in settlement and subsistence patterns involving an increasing reliance on corn horticulture (Fox 1990: 185; Smith 1990; Williamson 1990: 312). Corn may have been introduced into southwestern Ontario from the American Midwest as early as 1500 BP or a few centuries before. Corn did not become a dietary staple, however, until at least three to four hundred years later, and then the cultivation of corn gradually spread into south-central and southeastern Ontario.

During the early Late Woodland, particularly within the Princess Point Complex (circa 1450 – 900 BP), a number of archaeological material changes have been noted: the appearance of triangular projectile point styles, first seen during this period begin with the Levanna form; cord-wrapped stick decorated ceramics using the paddle and anvil forming technique replace the mainly coil-manufactured and dentate stamped and pseudo-scallop shell impressed ceramics; and if not appearance, increasing use of maize (Zea mays) as a food source (e.g., Bursey 1995; Crawford et al. 1997; Ferris and Spence 1995: 103; Martin 2004 [2007]; Ritchie 1971: 31-32; Spence et al. 1990; Williamson 1990: 299).

The Late Woodland Period is widely accepted as the beginning of agricultural life ways in south-central Ontario. Researchers have suggested that a warming trend during this time may have encouraged the spread of maize into southern Ontario, providing a greater number of frost-free days (Stothers and Yarnell 1977). Further, shifts in the location of sites have also been identified with an emphasis on riverine, lacustrine and wetland occupations set against a more diffuse use of the landscape during the Middle Woodland (Dieterman 2001).

The first agricultural villages in southern Ontario date to the 10th century. Unlike the riverine base camps of the Middle Woodland Period, these sites are located in the uplands, on well-drained sandy soils. Village sites dating between 1050 – 650 BP share many attributes with the historically reported Late Woodland sites, including the presence of longhouses and sometimes palisades. However, these early longhouses were not all that large, averaging only 12.4 metres in length (Dodd et al. 1990: 349; Williamson 1990: 304-305). It is also quite common to find the outlines of overlapping house structures, suggesting that these villages were occupied long enough to necessitate re-building.

The Jesuits reported that the Huron moved their villages once every 10-15 years, when the nearby soils had been depleted by farming and conveniently collected firewood grew scarce (Pearce 2010). It seems likely that Early Late Woodland peoples occupied their villages for considerably longer, as they relied less heavily on corn than did later groups, and their villages were much smaller, placing less demand on nearby resources.

Judging by the presence of carbonized corn kernels and cob fragments recovered from sub-floor storage pits, agriculture was becoming a vital part of the Early Late Woodland economy. However, it had not reached the level of importance it would in the Middle Late and Late Woodland Periods. There is ample evidence to suggest that more traditional resources continued to be exploited and comprised a large part of the subsistence economy. Seasonally occupied special purpose sites relating to deer procurement, nut collection, and fishing activities, have all been identified. While beans are known to have been cultivated later in the Late Woodland Period, they have yet to be identified on Early Late Woodland sites.

The Middle Late Woodland Period (650 – 550 BP) witnessed several interesting developments in terms of settlement patterns and artifact assemblages. Changes in ceramic styles have been carefully documented, allowing the placement of sites in the first or second half of this 100-year period. Moreover, villages, which averaged approximately 0.6 ha in extent during the Early Late Woodland Period, now consistently range between 1 and 2 ha.

House lengths also change dramatically, more than doubling to an average of 30 m, while houses of up to 45 m have been documented. This increase in longhouse length has been variously interpreted. The simplest possibility is that increased house length is the result of a gradual, natural increase in population (Dodd et al. 1990: 323, 350, 357; Smith 1990). However, this does not account for the sudden shift in longhouse lengths around 650 BP. Other possible explanations involve changes in economic and socio-political organization (Dodd et al. 1990: 357).

One suggestion is that during the Middle Late Woodland Period small villages were amalgamating to form larger communities for mutual defense (Dodd et al. 1990, p. 357). If this was the case, the more successful military leaders may have been able to absorb some of the smaller family groups into their households, thereby requiring longer structures. This hypothesis draws support from the fact that some sites had up to seven rows of palisades, indicating at least an occasional need for strong defensive measures. There are, however, other Middle Late Woodland villages which had no palisades present (Dodd et al. 1990). More research is required to evaluate these competing interpretations.

The lay-out of houses within villages also changes dramatically by 650 BP. During the Early Late Woodland Period villages were haphazardly planned, with houses oriented in various directions. During the Middle Late Woodland Period villages are organized into two or more discrete groups of tightly spaced, parallel aligned, longhouses. It has been suggested that this change in village organization may indicate the initial development of the clans which were a characteristic of the historically known Iroquoian peoples (Dodd et al. 1990: 358).

Initially at least, the Late Late Woodland Period (550 – 350 BP) continues many of the trends which have been documented for the proceeding century. For instance, between 500 and 450 BP house lengths continue to grow, reaching an average length of 62 m. One longhouse excavated on a site southwest of Kitchener was an incredible

123 m (Lennox and Fitzgerald 1990: 444-445). After 450 BP, house lengths begin to decrease, with houses dating between 400 – 320 BP averaging 30 m in length.

Why house lengths decrease after 450 BP is poorly understood, although it is believed that the even shorter houses witnessed on historical period sites can be at least partially attributed to the population reductions associated with the introduction of European diseases such as smallpox (Lennox and Fitzgerald 1990:405, 410).

Village size also continues to expand throughout the Late Late Woodland Period, with many of the larger villages showing signs of periodic expansions. The latter part of the Middle Late Woodland Period and the first century of the Late Late Woodland Period was a time of village amalgamation. One large village situated just north of Toronto has been shown to have expanded on no fewer than five occasions. These large villages were often heavily defended with numerous rows of wooden palisades, suggesting that defence may have been one of the rationales for smaller groups banding together. Late Late Woodland village expansion has been clearly documented at several sites throughout southwestern and south-central Ontario. The excavations at the Lawson site, a large village located in southwestern Ontario, has shown that the original village was expanded by at least twenty percent to accommodate the construction of nine additional longhouses (Anderson 2009).

1.2.2 Post-Contact Regional History

Following European settlement in North America, the nature of Indigenous settlement size, population distribution, and material culture shifted as settlers began to colonize the land. Despite this shift in Indigenous life ways, “written accounts of material life and livelihood, the correlation of historically recorded villages to their archaeological manifestations, and the similarities of those sites to more ancient sites have revealed an antiquity to documented cultural expressions that confirms a deep historical continuity to Iroquoian systems of ideology and thought” (Ferris 2009, p. 114). As a result, Indigenous peoples of southern Ontario have left behind archaeologically significant resources throughout southern Ontario which show continuity with past peoples, even if this connection has not been recorded in historical Euro-Canadian documentation.

The Study Area is situated within the former Toronto Township, County of Peel, now City of Mississauga, Regional Municipality of Peel, Ontario. This geographic area was inhabited by the Mississauga First Nation at the time of initial Euro-Canadian contact. This nation subsequently ceded lands to Chief Joseph Brant and the Crown through four separate treaties from 1805 to 1820 (Morris 1943, pp. 22-25). The course and details of these events are summarized briefly below:

- *Treaty No. 13A (The First Purchase):* August 2, 1805 – This treaty comprises the fronts of the Townships of Toronto, Trafalgar and Nelson, except the 3,450 acres granted to Chief Joseph Brant in 1797. It includes 74,000 acres of land excluding a one-mile strip on each side of the Credit River from the waterfront to the base line (modern Eglinton Avenue), which was the Credit Indian Reserve (Heritage Mississauga 2009). It is described as follows (Morris 1943, p. 22):

  > *Commencing at the eastern bank of the mouth of the River Etobicoke, being in the limit of the western boundary line of the Toronto Purchase, in the year 1787; then north twenty-two degrees west, six miles; thence south 38 degrees west, twenty-six miles more or less, until it intersects a line on the course north 45 degrees west, produced from the outlet of Burlington Bay; then along the said produced line, one mile more or less to the lands granted to Captain Brant; then north 45 degrees east, one mile and a half; then south 45 degrees east, three miles and a half more or less to Lake Ontario; then north easterly along the waters edge of Lake Ontario to the eastern bank of the River Etobicoke being the place of beginning.*

- *Treaty No. 19 (The Second Purchase)*: October 28, 1818 – An agreement reached by the Principal Men of the Mississauga Nation of Indians, inhabiting the River Credit, and Twelve- and Sixteen-Mile Creeks on the north Shore of Lake Ontario. Over 600,000 acres of land, representing most of what is known today as the Region of Peel, were surrendered (Heritage Mississauga 2009). The tract of land was described as follows (Morris 1943: 24):

  > *A tract of land in the Home District called the Mississague Tract, bounded southerly by the purchase made in 1806; on the east by the Townships of Etobicoke, Vaughan and King; on the south west by the Indian Purchase, extending from the outlet of Burlington Bay, north forty-five degrees west, fifty miles; and from thence north seventy-four degrees east or thereabouts, to the north west angle of the Township of King.*

- *Treaty No. 22*: February 28, 1820 – ". . . the Principal Chiefs, Warriors and People of the Mississauga Nation transferred to His Majesty George the Third for the sum of 20 shillings, parts of those tracts of land at Credit River, Sixteen Mile Creek and Twelve Mile Creek, formerly reserved in Treaty 13A . . ." (Morris 1943: 25).

- *Treaty No. 23*: February 28, 1820 – "… the Principal chiefs, Warriors and People of the Mississauga Nation, transferred to His Majesty George the Third for the sum of 50 pounds, parts of those tracts of land at Credit River, Sixteen Mile Creek, and Twelve Mile Creek, formerly reserved in 13A . . ." (Morris 1943: 25).

By 1821, the Mississauga First Nation had surrendered most of the Credit Indian Reserve lands set aside in 1805 in the final two "Credit Treaties." In 1847, the remaining members of the Mississaugas relocated to the New Credit Reserve (now Mississaugas of the Credit First Nation) in Hagersville (Heritage Mississauga 2009). The geographic area now known as the City of Mississauga has since been farmed, settled and developed by families and communities of European descent.

1.2.3 Toronto Township, Peel County

Toronto Township was established during the "Old Survey" of 1806 following the signing of Treaty 13A (Heritage Mississauga 2009); this survey established the southern half of the township (Riendeau 1985: 23). Just over a decade later, after the signing of Treaty 19, the "New Survey" of the area, which occurred in 1819, divided the acquired lands into the Townships of Toronto, Chinguacousy, Caledon, Albion and Toronto Gore (Heritage Mississauga 2009); this survey established the northern half of the Township (Riendeau 1985: 23). Toronto Township was incorporated in 1850 as a primarily rural society (City of Mississauga 2004).

Peel County and its townships were originally settled by British soldiers and their families, many of whom served with the Queen's Rangers, during the late 18th century and into the early 19th century (Bull 1935).
As the number of farmsteads and homesteads within the county grew, several villages and communities were established. Those that thrived into the 20th century and were amalgamated into the City of Mississauga in 1974 include: Clarkson, Cooksville, Dixie, Erindale, Malton, Meadowvale, Port Credit and Streetsville (Heritage Mississauga 2009). These villages assisted in the processing of local natural resources including lumber, grain and other farm products (City of Mississauga 2004). Port Credit, Streetsville and Meadowvale thrived early on given their location on the Credit River, a transportation route and the site of several lumber and grist mills (City of Mississauga 2004).

With the establishment of military headquarters at York, there was a need to develop and maintain reliable ground transportation routes for provisioning both soldiers and supplies throughout Upper Canada. Dundas Street was the first major "highway" constructed in the region, by military engineers (Bull 1935). This main transportation route was subsequently used by various Loyalist settlers following the surveying and establishment of new townships and communities. The existing forests were cut down for the growing of crops and the raising of livestock.

The arrangement of people within Toronto Township changed once again in the mid-19th century with the establishment of the railways. This influenced the development of southern villages including Clarkson and Lorne Park which were affiliated with the Great Western Railway and northern villages such as Malton, which was affiliated with the Grand Trunk Railway (City of Mississauga 2004).

1.2.3.1 Missinnihe/Credit River

The water source known as present-day Credit River was named Missinnihe ("trusting creek") by the Mississaugas. The Mississaugas used the river and its surrounding area for hunting, fishing, gathering, healing, and spiritual purposes (MNCFN 2018). A trading post was established at the mouth of the river by the French in the 18th century, which enabled the trade of pelts gathered over the winter for European goods.

The Missinnihe was renamed the Rivière au Crédit by the French, which translated to Credit River, and referred to the traders' practice of extending credit to the Mississaugas in the fall and then being repaid the following spring with the winter's catch of furs. The Mississaugas located at the western end of the lake became known to the Europeans as the Mississaugas of the Credit.

1.2.3.2 Port Credit

Old Port Credit Village was first formally surveyed in 1834, and the first sale of lots being held at a public auction in Toronto in 1835 (Smith 1846: 148). By 1842, a post office was established in the village, at which time the name of the community "officially" became Port Credit. The name had been in use since at least 1835, or slightly before that time (Walton 1837; Rayburn 1997: 276; Scott 1997: 182).

Plans for a formal harbour at Port Credit date back to March 1828, when an act was passed by the government of Upper Canada for the construction of a harbour at the nearby Sixteen Mile Creek in Oakville (9 Geo. IV c. 19). Further legislation was passed in March 1834, which incorporated the "Credit Harbour Company" as a joint-stock company, and provided for a loan to assist with the work then in progress. The work of improving the harbour was undertaken at an estimated cost of £2,500. The Mississaugas acquired a 2/3 interest in this company. Work on the harbour was contracted to E.W. Thomson, and harbour tolls were collected to recoup the investment (Smith 1851: 276; Smith 1987: 157; Robb 2003 9).

During the mid-1840s, a large quantity of farm produce and timber was shipped from Port Credit. The primary goods shipped from Port Credit in 1844 included: wheat, flour, pork, ashes, whiskey, timothy seed, wool, lumber, and oak and pine "squared timber." As late as 1876, it was recorded that Clarkson and Chisholm bought and shipped 100,000 bushels of wheat from the harbour at Port Credit (Smith 1846: 149; Kirkwood 1967: 257). The population at this time reached 150, and the village had a Methodist church, blacksmith shop, schoolhouse, post office, and other small businesses.

Shipbuilding is said to have been carried on at the mouth of the Credit as early as 1809, but it became a major industry there by the 1840s. Five schooners "of a good class" were then owned by local merchants and businessmen. The community was linked by steamer service to Toronto and Hamilton in the period before the advent of the railways (Smith 1846: 149; Gibson 2002: 180).

By 1851, the population of the village had increased to about 200 inhabitants. It was described as the "shipping place for a large extent of fertile and well-cultivated country" (Smith 1851:276). In 1857, the population of Port Credit had reached 400 inhabitants, and many of the families were connected to the shipbuilding trade. The introduction of the Great Western Railway (GWR) to the area aided communication and travel from Port Credit to both Toronto and Hamilton, however, it also diverted a portion of the shipping activity away from the harbour (Riendeau 1985). The Port Credit rail station was opened in December 1855, near Stavebank Road. (Clarkson

1967). In 1855, the harbour suffered from a fire, causing the shipping activity to be further affected. By the mid-1860s, the population decreased to 350.

The harbour in 1851 was still bordered “by a considerable breadth of marsh” (Smith 1851:276). At that time, a new bridge was under construction. It was considered a necessary work, “the old bridge having been for years in a dangerous state” (Smith 1851: 276). The first wooden bridge at the mouth of the Credit was built in 1820. It was replaced by a second structure of timber truss construction, erected in 1832 at a cost of £50 by local merchants Chisholm and Gamble. This bridge was damaged in a flood in 1850 and replaced by another wooden one that was under construction in 1851. It stood until September 1895, when it was washed away in a storm and later replaced by an “iron bridge”. This bridge was replaced by concrete, bow-string structure in 1919. The concrete bridge is known to have remained in use until at least 1949, but it had been replaced by a more modern, four-lane, concrete structure in 1960-61 (Kirkwood 1967: 257; Gibson 2002: 181; Robb 2003: 23; Hicks 2007: xxxiv-xxxv).

During the 1850s, the “Lake Road” was purchased by the Toronto Road Company, which collected tolls and was responsible for its maintenance. Between 1914 and 1917, Lakeshore Road was cemented under the supervision of the Toronto-Hamilton Highway Commission. It became known as Highway 2 upon the completion of the work on the entire length of this road in 1922 (Gibson 2002: 188; Hicks 2007: xxviii).

By the close of the 19th century, the St. Lawrence Starch Company had located here, as well as a few brickyards. During the 20th century, a few oil refineries also located in the area which provided additional employment opportunities for the village.

By 1900, the population had increased to 650, making Port Credit the largest village in Toronto Township (Riendeau 1985). In 1909, Port Credit became a Police Village as its population had reached 750 residents, and by 1914, Port Credit incorporated as a Village. By 1945, the population of the village had reached 2,325, and it was elevated to a town by an act of the Provincial legislature in 1961. At that time, its population had increased by over 6,500. It was annexed to the City of Mississauga in 1974 (Kirkwood 1967: 258; Rayburn 1997: 276; Gibson 2002: 188; Robb 2003: 17).

1.2.4 Study Area History

A review of the 1859 Historical County Map of Peel County (Tremaine 1859) (Map 3) identifies the Study Areas in relation to the Port Credit Town Plot. A railway is located adjacent to Study Area 4 while Study Areas 2 and 5 are adjacent to two historical roads. Study area 7, is located adjacent to a historical road on the west bank of the Credit River. In 1859, five of the Study Areas are located within lands owned by Robert Cotton and R. & J. Cotton, while Study Areas 3 and 7 resides within the Town Plot. Robert Cotton owned the lands west of the railway where Study Areas 4 and 6 are situated (Tremaine 1859). R. & J. Cotton is listed as the owner for the lands located adjacent to Lake Ontario where Study Areas 1, 2 and 5 are situated. Study Area 2 is located within lands also owned by Robert Cotton.

The 1877 Map of the Township of Toronto (Walker & Miles 1877) (Map 4) shows Study Area 1 to reside within the lands of Robert Cotton Esq. while Study Areas 2, 4, 5 and 6 reside within the lands of James W. Cotton, who is shown to own the land to the west of the railway. Study Areas 3 and 7 resides in the Town Plot. Study Areas 5 and 6 is shown within 300 m of creeks.

Robert Cotton emigrated from Ireland to Canada in 1837 where he became a well-known merchant and farmer in Toronto Township (Canadian Historic Places ND). Cotton held several offices in the community including the Justice of Peace in 1850. Cotton purchased land on the west side of Old River Road and had a house built in 1856 (Canadian Historic Places ND). Upon his death in 1885, Robert Cotton transferred the Cotton Homestead to James W. Cotton, his brother. James worked alongside Robert as a postmaster, storemaster and was the owner of a Wharf. The Cotton brothers are considered to be the “Fathers” of Port Credit (Canadian Historic Places ND).

Aerial photographs (Map 5) show the history of the development of the Study Area from the mid-20th century onward. In 1954, the Study Area is located within commercial and residential areas, undeveloped parkland and agricultural fields. Study Area 5 appears to have been the location of a building and parking lot. By 1966, the mouth of the Credit River has been substantially altered by the construction of the Port Credit Harbour Marina. Study Area 1, which is west of the Elmwood SPS, within the present Tall Oaks Park, appears to have been redeveloped from industrial to residential and parkland during the late 1990s. Study Area 2, a parking lot along Lakeshore Blvd, and Study Area 3, a parking lot west of the Port Credit Marine Harbour, appear to have been paved over after 1986. Study Areas 4 and 6, which is adjacent to the Rosemere SPS shows no significant landscape alterations other than the construction of the station. Study Area 5 saw further development between 1966 and the 2010s until it was turned into its current park conditions. Due to the substantial development during the 20th century, Study Area 5 is entirely disturbed. Study Area 7 is shown as in the Port Credit River in 1954 which suggests the area may have been infilled sometime before 1966.

1.2.5 Study Area Environment

The Study Areas are located within the City of Mississauga on the north shore of Lake Ontario. They are situated within the Iroquois Plain physiography region which extends from the western part of Lake Ontario to the Trent River (Chapman and Putnam 1984: 190). The Iroquois Plain physiography region was formed during the last Glaciation when the region was covered by a water body known as Lake Iroquois. Its width varies from several hundred meters up to 13 km. This plain is the remnant shoreline of glacial Lake Iroquois and was smoothed over time by wave action and lacustrine deposits. Now this physiographic region is composed of a thin veneer of glacio-lacustrine sand and silty sand. These sandy soils once supported forests, savannahs, and prairies, populated by species of the Carolinian Ecoregion at close to their northern extent. The Iroquois Plain was a general farming area, with a tendency for horticulture and growth of canning crops. Since World War II, the remaining farms have become larger while much of the land has been put to urban uses.

The surficial geology consists of interbedded flow till and modern alluvial deposits in Study Area 1, interbedded flow till entirely within Study Area 2, both foreshore basin deposits and modern alluvial deposits in Study Area 3, foreshore basin deposits entirely within Study Area 4, and a mix of modern alluvial and foreshore-basinal deposits in Study Area 5 (Map 6). Study Area 6 consists of foreshore basinal deposits and Study Area 7 consists of mostly modern alluvial deposits.

1.2.6 Previous Archaeological Assessments

Several Archaeological Assessments have previously been conducted within 50 m of the Study Area (Map 7).

In 2008, Archeoworks Inc. completed a Stage 1 Archaeological Assessment for the proposed Hurontario High Order Transit Development in the cities of Brampton and Mississauga (2010). This Archaeological Assessment determined portions of the project limits to have archaeological potential and the remainder to have low to no archaeological potential. Areas of archaeological potential were recommended to be subjected to a Stage 2 Archaeological Assessment. The southern portion of Archeoworks' Stage 1 Archaeological Assessment project limits are located immediately adjacent to the western limits of Study Area 3.

ASI undertook a Stage 1 Archaeological Assessment for the proposed redevelopment of 31 Lakeshore Road East, part of Harbour Company Plot Plan PC-2 (Port Credit), in the City of Mississauga (2012). This Archaeological Assessment determined the project limits to have no archaeological potential and recommended the project area to be free of further archaeological concern, with the provision that the appropriate authorities must be notified if deeply buried archaeological deposits or human remains are encountered. The southern portion of ASI's Stage 1 Archaeological Assessment limits is located approximately 50 m northwest of Study Area 3.

ASI conducted Stage 1 and 2 Archaeological Assessment along Mona Road which resulted in the discovery of AjGv-83, an Archaic and Woodland campsite (ASI 2016a; 2016b). The site was mitigated through Stage 3 and 4 Archaeological Assessment and was fully documented and excavated under the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011) and has no further cultural heritage value or interest (ASI 2016c; 2016d). The Stage 1 to 4 Archaeological Assessments took place approximately 50 m northeast of Study Area 4.

In 2017, ASI (2017) undertook a Stage 1 Archaeological Assessment for three SPS upgrades, one of which was the Rosemere SPS. Portions of the Rosemere Road Study Area assessed by ASI were identified as having archaeological potential and recommended for Stage 2 Archaeological Assessment. The Stage 2 Archaeological Assessment found the entire Rosemere SPS Study Area was disturbed and made the following recommendations (ASI 2018:i)

1) *The Study Area for the Mississauga Sewage Pumping Station Upgrades, including the Rosemere Road, Indian Road, and Silver Birch Trail sewage pumping stations, has been fully documented, and no further archaeological assessment is required on these lands; and*

2) *Should the proposed work extend beyond the current Study Area, further archaeological assessment must be conducted to determine the archaeological potential of the surrounding lands.*

The Stage 1 and 2 Archaeological Assessment completed by ASI overlaps with the eastern portion of Study Area 4.

In 2018, 4Transit, a joint venture of Hatch, Parsons, and WSP, conducted a Stage 1 Archaeological Assessment as part of the Building Rehab & Elevator Replacement – Port Credit and Port Credit GO Station Parking Structure Joint Development (2018). The Stage 1 Archaeological Assessment determined parts of the project area to have archaeological potential requiring a Stage 2 Archaeological Assessment. The western limits of the area assessed as part of the Stage 1 Archaeological Assessment is located approximately 17 m southeast of Study Area 4.

Between 2017 and2018, WSP (2017; 2018) conducted a Stage 1 and 2 archaeological assessment for a diversion sewer along Front Street. This assessment included the lands encompassed by Study Area 7 which was subject to test pit survey at 5 m intervals and determined to be entirely disturbed. WSP (2018) made the following recommendation:

1) *The Stage 2 test pit survey yielded archaeological materials and modern materials from a clearly disturbed context within Port Credit Memorial Park. No further archaeological assessment is recommended.*

In 2021, Golder Associates conducted a supplemental Stage 1 Archaeological Assessment as part of a Schedule ‘C’ Municipal Class Environmental Assessment for the proposed Port Credit East Water and Wastewater Servicing Optimization Strategy(Golder 2021). The Stage 1 Archaeological Assessment determined parts of the Study Area to have archaeological potential requiring a Stage 2 Archaeological Assessment.

1.2.7 Registered Archaeological Sites

The primary source of information regarding known archaeological sites in the vicinity of the Study Area was the OASD. The OASD was consulted on October 13, 2021, and it was determined that there are 17 registered archaeological sites located within 1 km of the greater Study Area (Table 2). Four archaeological sites are located within 300 m of the Study Area; two of which are within 300 m of Study Area 3 and two of which are within 300 m of Study Area 4.

Table 2: Registered Archaeological Sites within 1 km of the Study Area

Borden Number	Name	Time Period	Cultural Affiliation	Site Type	Current Development Review Status	Study Area within 1 km
AjGv-1**	Hare	Pre-Contact	Archaic, Woodland, Middle	Campsite	Further CHVI	3, 4, 5, 6, 7
AjGv-4	Stillmeadow	Pre-Contact	Woodland	Camp/campsite	Further CHVI	4, 6
AjGv-5	Glenburny	Pre-Contact	Indigenous	Campsite	No further CHVI	4, 5, 6, 7
AjGv-8	Eley	Pre-Contact	Archaic	Campsite	Further CHVI	2, 5, 6
AjGv-9	Avonbridge	Pre-Contact	Archaic	Campsite	No further CHVI	1, 5, 6, 7
AjGv-10	Stavebank	–	–	–	No further CHVI	4, 6, 7
AjGv-11***	Port Street	–	–	–	No further CHVI	1, 3, 4, 5, 6, 7

** *denotes site within 300 m of Study Area 4*
*** *denotes site within 300 m of Study Area 7*

AjGv-1 (Hare) was identified as a pre-contact Indigenous campsite in 1971. The site is located on the bank of the Credit River and has been dated to the Archaic (Laurentian) and Middle Woodland periods. AjGv-1 (Hare) consists of an unknown amount of ceramic material and lithics. It was believed to have been destroyed by development. However, a further investigation by York University found evidence of ceramic material and lithics which proves the site is not destroyed and retains some cultural heritage value or interest. The site is located approximately 200 m west of Study Area 4.

AjGv-13 (Fort Toronto) was identified in 1971 and is located at the mouth of the Credit River, along the west bank. AjGv-13 (Fort Toronto) is identified as a Post-Contact Indigenous village and according to the site form the site has been destroyed by development. The current status of the site is unknown, but it is presumed no further archaeological work has been conducted since the 1971 investigations as there are no records of further stages of work, nor are there are licensee recommendations or corresponding reports associated with the site form. The site is located approximately 195 m southwest of Study Area 3.

AjGv-71 (James Taylor) is a Post-Contact historical site identified through Stage 2 mechanical trench excavation in 2010 by ASI and is located within Marina Park in Mississauga, under a parking lot. The site consists of a small scatter of Post-Contact Euro-Canadian artifacts recovered in an area 30 m by 20 m. The site was then subjected to Stage 3 test trenching under PIF no. P372-0083-2020. The Stage 3 test trenching in 2020 resulted in the recovery of seven additional artifacts and the site was dated to the early to mid-19th century. AjGv-71 (James Taylor) has been recommended by ASI for Stage 4 long term protection as it has further cultural heritage value or interest. The site is located approximately 220 m southwest of Study Area 3, however is located on the other side of the Credit River.

AjGv-83 was identified through Stage 2 test pit survey in 2016 by ASI under PIF no. P046-0158-2016. The site consisted of Indigenous artifacts within an area measuring 5 m by 2 m. The site was subjected to Stage 3 test unit excavation under PIF no. P223-0103-2016 and resulted in the recovery of 61 artifacts in an area measuring 20 m by 15 m. The site was recommended for Stage 4 archaeological mitigation, which was also completed in 2016 and which resulted in an additional 832 artifacts being recovered in an area measuring 40 m by 40 m. Based on the features uncovered and the artifacts recovered, AjGv-83 is identified as Middle to Late Archaic and Woodland campsite. While the site within the project area underwent full mitigation under PIF no. P223-0107-2016, it was noted in the site record that the MCM concluded the site may extend beyond the subject property ASI investigated and therefore may still have further cultural heritage value or interest. The site is located approximately 100 m north of Study Area 4.

1.2.8 Cultural Heritage Resources

According to the City of Mississauga's *Heritage Designation Properties* gallery (2020), the City of Mississauga's *Heritage Register* (2018), the City of Mississauga's *Cultural Heritage Landscape Inventory* (2005), the City of Mississauga's *Cultural Heritage Landscape Project* (ND), and re-utilizing research from a Stage 1 report obtained during a consultation with heritage planning staff at the City of Mississauga, four protected heritage properties designated under Part IV of the *Ontario Heritage Act*, and three cultural heritage landscapes listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes* are within and within 300 m the Study Area (Table 3; Map 8). Per Section 1.3 and 1.4 of the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011), property listed on a municipal register or designated under the *Ontario Heritage Act* or that is a federal, provincial, or municipal historic landmark or site is indicative of archaeological potential.

Table 3: Known Cultural Heritage Resources within and within 300 m of the Study Area

Civic Address or Location	Description	Cultural Heritage Status	Study Area within or within 300 m
40 Stavebank Road	Port Credit Memorial Arena, constructed 1959	Protected heritage property designated under Part IV of the *OHA* (By-law 261-2011)	4
29 Stavebank Road North	Cenotaph Park, Cenotaph constructed in 1925	Protected heritage property designated under Part IV of the *OHA* (By-law 118-84)	4

Civic Address or Location	Description	Cultural Heritage Status	Study Area within or within 300 m
90 High Street East	William Thomas Gray House, constructed in 1909, John Francis Brown (architect)	Protected heritage property designated under Part IV of the *OHA* (By-law 385-2005)	1, 2, 5
Old Port Credit	Located west of the Credit River and straddling Lakeshore Road	Listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*	3,4, 5, 7
Port Credit Harbour	Located in Port Credit at the Mouth of the Credit River	Listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*	3, 7
141 Lakeshore Road East	St. Lawrence Starch Limited Administration Building, constructed in 1932	Protected heritage property designated under Part IV of the *OHA* (By-law 446-93)	1, 2, 5
Mineola Neighbourhood	Located north of Lakeshore Road bounded by the Credit River on the west and Hurontario on the east	Listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*	4

2.0 FIELD METHODS

A visual inspection of the Study Areas was completed by Martha Tildesley, M.A. (P399) and Rhiannon Fisher, M.Sc. on October 20, 2021, July 27, 2022, and May 2, 2023 under PIF P468-0081-2021 issued to Rhiannon Fisher, M.Sc. (P468). The weather was conducive for assessing the archaeological potential. On October 20, 2021, the weather was sunny and warm with a high of 20 degrees Celsius. On July 27, 2022, the weather was sunny with a high of 27 degrees Celsius. On May 2, 2023, the weather was partly cloudy with a high of 11 degrees Celsius. The Study Areas consists of public spaces, so no permission was required to enter the Study Areas. The results of the visual inspection and the locations of photographs taken are shown in Map 9.

Study Area 1 is located within the southwestern portion of Tall Oaks Park along the waterfront of Lake Ontario. It consists of garden boxes, waterfront trails, paved lookout areas, and large green spaces (Images 1-24, pp. 29-40). The southern portion of the park slopes down toward the waterfront, but the remaining area is flat. While background research suggests that portions of the park were impacted during redevelopment of the surrounding area from an industrial area to residential neighbourhoods, portions of the park appear to be relatively undisturbed.

Study Area 2 is located within a commercial area along Lakeshore Road East and is currently a paved parking lot (Images 25-29, pp. 41-43).

Study Area 3 is located west of the Port Credit Harbour Marina and is currently a paved parking lot with small landscape design areas (i.e., gardens, manicured lawn boulevards) (Images 30-38, pp. 43-47).

Study Area 4 is located southwest of the Rosemere SPS and adjacent to Kenollie Creek, a tributary of the Credit River. The Study Area consists of grassland, and slopes down toward the creek and slopes up to both Rosemere Road and Stavebank Road (Images 39-46, pp. 48-51). There is also a metal drainage pipe that empties into the Study Area (Image 40, p. 48). The Rosemere SPS and the ROW of Rosemere Road have been previously assessed and recommended for no additional Archaeological Assessment (ASI 2018; Golder 2021). A small portion of the area appears to be relatively undisturbed.

Study Area 5 is located within Harold E. Kennedy Park which is located along Rosewood Avenue. The study area currently consists of open park with some disturbance from a walkway and utilities (Images 47-49, pp. 52-53). Background research indicates this area was developed until the early 2010s and current conditions are recent.

Study Area 6 is located south of Mona Road and Sandham Road. The study area consists of a flat road right-of-way located at the top of a slope (Image 50, p. 53).

Study Area 7 was identified as entirely previously assessed and required no additional site inspection.

3.0 ANALYSIS AND CONCLUSIONS

3.1 Assessing Archaeological Potential

Archaeological potential is established by determining the likelihood that archaeological resources may be present on a subject property. In accordance with the MCM's 2011 *Standards and Guidelines for Consultant Archaeologists* the following are features or characteristics that indicate archaeological potential:

- Previously identified archaeological sites;
- Water sources:
  - Primary water sources (lakes, rivers, streams, creeks);
  - Secondary water sources (intermittent streams and creeks; springs; marshes; swamps);
  - Features indicating past water sources (e.g. glacial lake shorelines indicated by the presence of raised gravel, sand, or beach ridges; relic river or stream channels indicated by clear dip or swale in the topography; shorelines of drained lakes or marshes; and cobble beaches);
  - Accessible or inaccessible shoreline (e.g. high bluffs, swamps or marsh fields by the edge of a lake; sandbars stretching into marsh);
- Elevated topography (eskers, drumlins, large knolls, plateaux);
- Pockets of well drained sandy soil, especially near areas of heavy soil or rocky ground; Distinctive land formations that might have been special or spiritual places, such as waterfalls, rock outcrops, caverns, mounds, and promontories and their bases (there may be physical indicators of their use, such as burials, structures, offerings, rock paintings or carvings);
- Resource areas including:
  - Food or medicinal plants;
  - Scarce raw minerals (e.g. quartz, copper, ochre or outcrops of chert);
  - Early Euro-Canadian industry (fur trade, mining, logging);
- Areas of Euro-Canadian settlement; and,
- Early historical transportation routes.

In recommending a Stage 2 property survey based on determining archaeological potential for a Study Area, the MCM stipulates the following:

- No areas within 300 m of a previously identified site; water sources; areas of early Euro-Canadian Settlement; or locations identified through local knowledge or informants can be recommended for exemption from further assessment;
- No areas within 100 m of early transportation routes can be recommended for exemption from further assessment; and,
- No areas within the property containing an elevated topography; pockets of well-drained sandy soil; distinctive land formations; or resource areas can be recommended for exemption from further assessment.

3.2 Archaeological Integrity

A negative indicator of archaeological potential is extensive below-grade land disturbance. This includes widespread earth movement activities that would have removed or relocated any archaeological resources to such a degree that their information potential and cultural heritage value or interest has been lost.

Activities that are recognized to cause sufficient disturbance to remove archaeological potential include: quarrying, major landscaping involving grading below topsoil, building footprints, and infrastructure development. Activities including agricultural cultivation, gardening, minor grading, and landscaping do not necessarily remove archaeological potential (MCM 2011:18). While there are areas of disturbance identified in the Study Areas in the form of paved parking lots and pathways, it is possible these areas still retain some archaeological potential, though background research and aerial mapping indicate these areas have likely been impacted by 20th and 21st century development.

3.3 Potential for Archaeological Resources

The Study Area has potential for archaeological resources due to the presence of several indicators of archaeological potential. Study Areas 1, 3 and 7 are located within 300 m of Lake Ontario or the Credit River. Additionally, Study Areas 4 and 6 are also within 300 m of Kenollie Creek and Stavebank Creek, tributaries of the Credit River. Potential for Indigenous archaeological resources is present within 300 m of registered Indigenous archaeological sites. There are two pre-contact Indigenous sites within 300 m of Study Area 3. The potential for Euro-Canadian archaeological resources is present within 100 m of the 19th century roads shown on the historic maps (Map 3 and Map 4). Study Area 1 and 2 are located within 100 m of historic roads. Study Areas 1, 2, 4, 5, and 6 are within 300 m from early Euro-Canadian settlement or properties designated under the Ontario Heritage Act while both Study Area 3 and 4 are located within Cultural Heritage Landscapes. There are two post-contact Euro-Canadian historical sites within 300 m of Study Area 4. Therefore, these Study Areas have archaeological potential for both Indigenous and Euro-Canadian archaeological resources.

The Study Area has many features that indicate archaeological potential, though there are some areas where the archaeological potential of the Study Area has been impacted by 20th century infrastructure. Study Area 1 is a public park and has evidence of disturbance in the form of pathways, paved public spaces, and landscaping/garden beds. Study Areas 2 and 3 have been paved over and are parking lots. A portion of Study Area 4 was impacted by the construction of the Rosemere SPS. During a previous Stage 2 test pit survey of the Rosemere SPS location, the area impacted by construction was determined to be completely disturbed (ASI 2018). The aerial photographs (Map 5) indicate Study Area 5 has been entirely disturbed by 20th century developed and has low potential for archaeological resources.

It should be noted that while registered archaeological site AjGv-71 (James Taylor) (see Section 1.2.7) was identified under a paved parking lot, approximately 220 m southwest of Study Area 3, during Stage 2 mechanical test trenching, the site is located on the other side of the river and the site limits were identified as being 30 m by 20 m, so it is unlikely the site extends into Study Area 3. The Stage 2 mechanical test trenching was undertaken as background research identified several historical structures that were known to have stood within the subject property ASI was assessing. While these structures were destroyed by an 1855 fire it was determined through background research that most of the facilities extant in 1832-1855 may not have been impacted by later construction events. Based on this information, it was determined potential for the recovery of archaeological resources associated with these occupations existed (ASI 2010:3) Although Study Area 3 exhibits similar existing conditions to that of the subject property AjGv-71 was identified within (i.e. a parking lot), there are no registered archaeological sites within Study Area 3, and an examination of the historical mapping indicates there are no

historical structures within Study Area 3, indicating the potential for archaeological resources related to previously extant buildings from the early to mid 19th century is low. Study Area 7 has been previously assessed and requires no additional archaeological assessment (WSP 2018).

Observed archaeological potential is limited to portions of the Study Areas not impacted by modern development, specifically within Tall Oaks Park (Study Area 1), Mona Road (Study Area 6), and a small area adjacent to the Rosemere SPS (Study Area 4). The remainder of the Study Areas consists of paved parking lots, commercial areas, and landscaping. While background research indicated the Study Areas exhibited archaeological potential due to the presence of a number of features, including proximity to water, registered archaeological sites, historical Euro-Canadian settlement and transportation routes, this archaeological potential has been significantly impacted by development during the 20th and 21st centuries. These areas showed evidence of substantial landscaping and the presence of infrastructure.

Maps 9A to 9G illustrate the Stage 1 Archaeological Assessment results for each Study Area.

4.0 RECOMMENDATIONS

The Stage 1 Archaeological Assessment and property inspections found that portions of the Study Area exhibited potential for the recovery of pre- and post-contact Indigenous and Euro-Canadian historical archaeological resources. Based on the findings of the Stage 1 Archaeological Assessment, the following recommendations are made, as illustrated in Map 9.

1) Lands that have been previously subjected to Archaeological Assessment(s) and cleared by the MCM of further archaeological concern are recommended to be exempt from further Archaeological Assessment.

    a) The portion of Study Area 4 that consists of the Rosemere SPS was previously assessed and no further assessment was recommended for that area (ASI 2017; Map 9D).

    b) Study Area 7 has been previously assessed and no further assessment was recommended for that area (WSP 2018; Map 9G).

2) The Stage 1 Archaeological Assessment has determined there is potential for the identification of archaeological resources within portions of the Study Area:

    a) Study Area 1; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9A).

    b) Study Area 4; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9D).

    c) Study Area 6; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9F).

    Stage 2 test pit survey at 5 m intervals is recommended for these areas prior to ground disturbance activities in accordance with Section 2.1.2 of the MCM's *Standards and Guidelines for Consultant Archaeologists* (2011). Test pits should be 30 cm in diameter and hand excavated 5 cm into sterile subsoil. If artifacts are recovered their location should be recorded with a GPS unit and test pit intervals reduced to 2.5 m within 5 m of the positive test pit, as well as a 1 m test unit if necessary.

3) Areas of previous disturbance were identified in portions of the Study Area. These areas of disturbance include parking lots, sidewalks/paved public spaces, and landscape design areas (i.e. gardens, grass boulevards) or past disturbance documented in historical aerial photographs. The Stage 1 Archaeological Assessment property inspection determined there is low potential for the identification of archaeological resources in portions of the Study Area:

    a) Study Area 1; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9A).

    b) Study Area 2; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9B).

    c) Study Area 3; Low archaeological potential within Study Area; no further Archaeological Assessment is recommended (Map 9C).

    d) Study Area 4; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9D).

    e) Study Area 5; Low archaeological potential within the entire Study Area; no further Archaeological Assessment is recommended for these areas (Map 9E).

Despite efforts and due diligence, no archaeological assessment can necessarily account for potential archaeological resources. Should deeply buried archaeological resources be identified during ground disturbance activity associated with future development of the Study Area, ground disturbance activities shall be immediately halted, and the Archaeology Division of the Culture Programs Unit of the MCM notified.

The MCM is requested to review, and provide a letter indicating their satisfaction with the results and recommendations presented herein, with regard to the 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licences, and to enter this report into the Ontario Public Register of Archaeological Reports.

5.0 ADVICE ON COMPLIANCE WITH LEGISLATION

This report is submitted to the Minister of Citizenship and Multiculturalism, as a condition of licensing in accordance with Part VI of the *Ontario Heritage Act*, R.S.O. 1990, c 0.18. The report is reviewed to ensure that it complies with the standards and guidelines that are issued by the Minister, and that the archaeological fieldwork and report recommendations ensure the conservation, protection, and preservation of the cultural heritage of Ontario. When all matters relating to archaeological sites within the project area of a development proposal have been addressed to the satisfaction of the MCM, a letter will be issued by the ministry stating that there are no further concerns with regard to alterations to archaeological sites by the proposed development.

It is an offence under Sections 48 and 69 of the *Ontario Heritage Act* for any party other than a licensed archaeologist to make any alteration to a known archaeological site or to remove any artifact or other physical evidence of past human use or activity from the site, until such time as a licensed archaeologist has completed archaeological fieldwork on the site, submitted a report to the Minister stating that the site has no further cultural heritage value or interest , and the report has been filed in the Ontario Public Register of Archaeology Reports referred to in Section 65.1 of the *Ontario Heritage Act*.

Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48 (1) of the *Ontario Heritage Act*. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act*.

The *Funeral, Burial and Cremation Services Act*, 2002, S.O. 2002, c.33, requires that any person discovering or having knowledge of a burial site shall immediately notify the police or coroner. It is recommended that the Registrar of Cemeteries at the Ontario Ministry of Consumer Services is also immediately notified.

Executive Summary

The Executive Summary highlights key points from the report only; for complete information and findings, as well as the limitations, the reader should examine the complete report.

WSP Canada Inc. (WSP) was retained by GM BluePlan Engineering Limited (GM BluePlan) to conduct a Stage 2 Archaeological Assessment as part of a Schedule 'C' Municipal Class Environmental Assessment (EA) for the proposed Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Class EA (the Project). The overall Stage 2 Study Area consists of five distinct areas. Study Area 1 is approximately 0.07 ha and is located approximately 70 m southwest of the Elmwood Sewage Pumping Station (SPS). Study Area 2 is approximately 0.34 ha and surrounds the Elmwood SPS. Both Study Area 1 and 2 are located within the current Tall Oaks Park. Study Area 3 is approximately 0.23 ha in size and surrounds the Hiawatha SPS, within the current Hiawatha Park. Study Area 4 is approximately 0.07 ha and is located approximately 5 m southwest of the Rosemere SPS. Study Area 5 is approximately 0.02 ha and is located south of Mona Road, approximately 185 m northeast of the Rosemere SPS. Cumulatively, the five distinct Study Areas encompass an area approximately 0.73 ha in size. Study Areas 1 to 3 are located within part of Lot C, Broken Front Concession, Study Area 4 is located within part of Lot 5, Range 1 Credit River I.R., and Study Area 5 is located within part of Lot 4, Range 1 Credit River I.R., Township of Toronto, Peel County, now the City of Mississauga, Regional Municipality of Peel.

Golder, now WSP Canada Inc., previously completed a Stage 1 Archaeological Assessment for the Project (Project Information Numbers [PIF] P468-0049-2020 & P468-0050-2020) which assessed the archaeological potential of an area that included road right-of-ways (ROW) as well as the locations of the Rosemere, Elmwood and Hiawatha SPS within an area generally limited by the Credit River in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Enola Avenue in the north, and Lake Ontario in the east (Golder 2021a). Following this previous study, GM BluePlan identified seven additional areas within the greater Project Area requiring Stage 1 Archaeological Assessment. The additional Stage 1 Archaeological Assessment for the Project (PIF P468-0081-2021) was carried out in between the Fall of 2021 and 2023 (WSP 2023). Both Stage 1 assessments determined portions of the Study Area retain archaeological potential for cultural heritage resources and, as such, Stage 2 Archaeological Assessment through test pit survey was recommended.

In November 2021, Golder conducted a Stage 2 Archaeological Assessment within four of the areas recommended for further work identified as Study Areas 1-4 above. These areas were subjected to a test pit survey at 5 m and 10 m intervals depending on conditions encountered. In October 2022, Golder conducted a Stage 1 and 2 Archaeological Assessment within the additional area identified as Study Area 5. Study Area 5 was subjected to a property inspection and test pit survey at 5 m intervals. During the Stage 2 Archaeological Assessment, two archaeological sites were identified: Location 1 and Tall Oaks (AjGv-95), both located within Study Area 2.

Location 1 consists of two pieces of Onondaga chert debitage recovered from two test pits. Cardinal test pits and a test unit were excavated, but there were no further finds. The site is located between the waterfront trail and Lake Ontario and measures approximately 5 m by 5 m. Based on these results, Location 1 does not meet Ministry of Citizenship and Multiculturalism (MCM) criteria for having sufficient cultural heritage value or interest to require Stage 3 Archaeological Assessment.

Tall Oaks (AjGv-95) yielded 30 pieces of Onondaga chert debitage from a single test pit. The site is located northeast of the Elmwood SPS and measures approximately 5 m by 5 m. Given the presence of at least five non-diagnostic pre-contact Indigenous artifacts within a 10 m by 10 m test pit survey area, as per *Section 2.2., Standards 1.a.ii (2)* of the MCM (2011), this site is considered to have further cultural heritage value and interest and a Stage 3 Archaeological Assessment is recommended.

Based on the results of the Stage 2 Archaeological Assessment documented herein, the following recommendations are presented:

1) **Location 1:** In accordance with *Section 2.2, Standard 1.a.ii.* (MCM 2011), Location 1 retains no further cultural heritage value or interest. No further archaeological assessment is recommended.

2) **Tall Oaks (AjGv-95):** Based on the results noted above, Stage 3 Archaeological Assessment is recommended for Tall Oaks (AjGv-95) in accordance with the MCM (2011) prior to any intrusive activity that may result in the destruction or disturbance to the site. The Stage 3 Archaeological Assessment should define the site extent, gather a representative sample of artifacts, and aid in the determination of a Stage 4 mitigation strategy, if required.

   The Stage 3 Archaeological Assessment should commence with the establishment of a site datum prior to beginning test unit excavation following the strategy for small pre-contact sites where it is not yet evident that the level of cultural heritage value or interest will result in a recommendation to proceed to Stage 4 mitigation (MCM 2011; *Section 3.2.3, Table 3.1, Standard 1 and 2)*.

3) Study Areas 1, 3, 4, and 5 retain no further cultural heritage value or interest. No further archaeological assessment is recommended for these areas.

Despite efforts and due diligence, no archaeological assessment can necessarily account for potential archaeological resources. Should deeply buried archaeological resources be identified during ground disturbance activity associated with future development of the Study Area, ground disturbance activities shall be immediately halted, and the Archaeology Division of the Culture Programs Unit of the MCM notified.

The MCM is requested to review and provide a letter indicating their satisfaction with the results and recommendations presented herein, with regard to the 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licences, and to enter this report into the Ontario Public Register of Archaeological Reports.

Study Limitations

WSP Canada Inc. (WSP) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the archaeological profession currently practicing under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty expressed or implied is made.

This report has been prepared for the specific site, design objective, developments and purpose described to WSP by GM BluePlan Engineering Limited (the Client). The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without WSP's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, WSP may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to WSP. The report, all plans, data, drawings and other documents as well as all electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of WSP. The Client acknowledges the electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client cannot rely upon the electronic media versions of WSP's report or other work products.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project.

Special risks occur whenever archaeological investigations are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain archaeological resources. The sampling strategies incorporated in this study comply with those identified in the MCM's *Standards and Guidelines for Consultant Archaeologists* (2011).

Project Personnel

Project Director	Heather Melcher, MSc, Director of Ecology, Ontario Earth and Environment
Project Manager	Kalena Lair, Environmental Assessment Specialist
Licensee	Rhiannon Fisher, MSc, RPA (P468), Lead Archaeologist
Licenced Field Director	Martha Tildesley, MA, RPA (P399), Archaeologist
Archaeological Field Technicians	Jessica Figura, Adam Goodlet, William Pettes
Report Production	Martha Tildesley
Technical Review	Rhiannon Fisher
Senior Review	Michael Teal, MA (P364), Archaeology Team Lead, Rhiannon Fisher
GIS/Mapping	Bojan Radojevic, GIS Analyst
Administration	Courtney Adey, Administrative Assistant

1.0 PROJECT CONTEXT

1.1 Development Context

WSP Canada Inc. (WSP) was retained by GM BluePlan Engineering Limited (GM BluePlan) to conduct a Stage 2 Archaeological Assessment as part of a Schedule 'C' Municipal Class Environmental Assessment (EA) for the proposed Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Class EA (the Project). The overall Stage 2 Study Area consists of five distinct areas. Study Area 1 is approximately 0.07 ha and is located approximately 70 m southwest of the Elmwood Sewage Pumping Station (SPS). Study Area 2 is approximately 0.34 ha and surrounds the Elmwood SPS. Both Study Area 1 and 2 are located within the current Tall Oaks Park. Study Area 3 is approximately 0.23 ha in size and surrounds the Hiawatha SPS, within the current Hiawatha Park. Study Area 4 is approximately 0.07 ha and is located approximately 5 m southwest of the Rosemere SPS. Study Area 5 is approximately 0.02 ha and is located south of Mona Road, approximately 185 m northeast of the Rosemere SPS. Cumulatively, the five distinct Study Areas encompass an area approximately 0.73 ha in size (Map 1 and Map 2). Study Areas 1 to 3 are located within part of Lot C, Broken Front Concession, Study Area 4 is located within part of Lot 5, Range 1 Credit River I.R., and Study Area 5 is located within part of Lot 4, Range 1 Credit River I.R., Township of Toronto, Peel County, now the City of Mississauga, Regional Municipality of Peel.

Golder, now WSP Canada Inc., previously completed a Stage 1 Archaeological Assessment for the Project (Project Information Numbers [PIF] P468-0049-2020 & P468-0050-2020) which assessed the archaeological potential of an area that included road right-of-ways (ROW) as well as the locations of the Rosemere, Elmwood and Hiawatha SPS within an area generally limited by the Credit River in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Enola Avenue in the north, and Lake Ontario in the east (Golder 2021a). Following this previous study, GM BluePlan identified seven additional areas within the greater Project Area requiring Stage 1 Archaeological Assessment. The additional Stage 1 Archaeological Assessment for the Project (PIF P468-0081-2021) was carried out between the Fall of 2021 and 2023 (WSP 2023). Both Stage 1 assessments determined portions of the Study Area retain archaeological potential for cultural heritage resources and, as such, Stage 2 Archaeological Assessment through test pit survey was recommended. GM BluePlan identified one additional study area, Study Area 5, which required both Stage 1 and 2 Archaeological Assessment.

The Stage 1 and 2 Archaeological Assessment was conducted under the professional archaeological consultant licensee P468, issued to Rhiannon Fisher of WSP (PIF P468-0083-2021). Permission to access the Study Area and conduct all required archaeological fieldwork activities, including the recovery of artifacts was granted by the Region of Peel.

1.2 Objectives

The objectives of the Stage 2 Archaeological Assessment are as follows:

- To document archaeological resources within the Study Area;
- To determine whether any identified archaeological resources require further assessment; and,
- To recommend appropriate Stage 3 assessment strategies, where required.

1.3 Historical Context

To establish the historical context of the Study Area, a review of Pre-Contact Indigenous and Historic Euro-Canadian settlement history was undertaken. This information is presented below in chronological order.

1.3.1 Regional Indigenous Pre-Contact History

The general culture history of southern Ontario based on Ellis and Ferris (1990), spanning the Pre-Contact Indigenous Period is summarised in Table 1.

Table 1: Overview of Cultural Chronology of Southern Ontario

Period		Time Period (circa)	Characteristics
Paleo	Early	10,950 – 10,350 BP	Gainey, Barnes and Crowfield traditions; Small bands; mobile hunters and gatherers and large territories; Fluted projectiles.
	Late	10,350 – 9950 BP	Holcomb, Hi-Lo and Lanceolate biface traditions; continuing mobility; Campsite/Way-Station sites; Smaller territories are utilized; Non-fluted projectiles.
Archaic	Early	9950 – 7950 BP	Side-notched, corner-notched, and bifurcate base traditions; growing diversity of stone tool types; heavy woodworking tools appear (e.g., ground stone axes and chisels).
	Middle	7950 – 4450 BP	Stemmed, Brewerton side- and corner-notched traditions; reliance on local resources; populations increasing; more ritual activities; fully ground and polished tools; netsinkers common; earliest copper tools.
	Late	4450 – 2900 BP	Narrow Point, Broad Point and Small Point traditions; less mobility; use of fish-weirs; more formal cemeteries appear; stone pipes emerge; long-distance trade.
Woodland	Early	2900 – 2350 BP	Meadowood tradition; cord-roughened ceramics emerge; Meadowood cache blades and side-notched points; bands of up to 35 people.
	Middle	2350 – 1400 BP	Saugeen, Point Peninsula and Couture traditions; stamped ceramics appear; Saugeen projectile points; cobble spall scrapers; seasonal settlements and resource utilization; post holes, hearths, middens, cemeteries, and rectangular structures identified.
	Transitional	1400 – 1050 BP	Princess Point tradition; cord roughening, impressed lines, and punctate designs on pottery; adoption of maize horticulture at the western end of Lake Ontario; oval houses and ‘incipient’ longhouses; first palisades; villages with up to 75 people.
	Early Late Woodland	1050 – 650 BP	Glen Meyer tradition; settled village-life based on agriculture; small villages (0.4 ha) with up to 75-200 people and 4-5 longhouses; semi-permanent settlements.
	Middle Late Woodland	650 – 550 BP	Uren and Middleport traditions; classic longhouses emerge; larger villages (1.2 ha) with up to 600 people; more permanent settlements (30 years).
	Late Woodland	550 – 350 BP	Larger villages (1.7 ha) with examples up to 5 ha and up to 2,500 people; extensive croplands; hamlets, cabins, camps, and cemeteries; potential tribal units; fur trade begins ca. 1580; European trade goods appear.

*(BP) Before Present Era dates are calculated using the year 1950 as the recognized start date of the present era.

Paleo Period

The first human occupation of southern Ontario begins just after the end of the Wisconsin Glacial Period. Although there were a complex series of ice retreats and advances which played a large role in shaping the local topography, south-central Ontario was finally ice free by 12,500 years ago.

The first human settlement can be traced back 11,000 years, when this area was settled by Indigenous groups that had been living south of the Great Lakes. The period of these early Indigenous inhabitants is known as the Paleo Period (Ellis and Deller 1990).

Our current understanding of settlement patterns of Early Paleo peoples suggests that small bands, consisting of probably no more than 25-35 individuals, followed a pattern of seasonal mobility extending over large territories. One of the most thoroughly studied of these groups followed a seasonal round that extended from as far south as Chatham to the Horseshoe Valley north of Barrie. Early Paleo sites tend to be located in elevated locations on well-drained loamy soils. Many of the known sites were located on former beach ridges associated with glacial lakes. There are a few extremely large Early Paleo sites, such as one located close to Parkhill, Ontario, which covered as much as six hectares. It appears that these sites were formed when the same general locations were occupied for short periods of time over the course of many years. Given their placement in locations conducive to the interception of migratory mammals such as caribou, it has been suggested that they may represent communal hunting camps. There are also smaller Early Paleo camps scattered throughout the interior of southwestern and south-central Ontario, usually situated adjacent to wetlands. Research suggests that population densities were very low during the Early Paleo Period (Ellis and Deller 1990: 54). Archaeological examples of Early Paleo sites are rare.

The Late Paleo Period (10,350 – 9950 BP) has been less well researched and is consequently more poorly understood. By this time the environment of south-central Ontario was coming to be dominated by closed coniferous forests with some minor deciduous elements. It seems that many of the large game species that had been hunted in the early part of the Paleo Period had either moved further north, or as in the case of the mastodons and mammoths, became extinct.

Like the Early Paleo peoples, Late Paleo peoples covered large territories as they moved about in response to seasonal resource fluctuations. On a province wide basis Late Paleo projectile points are far more common than Early Paleo materials, suggesting a relative increase in population.

The end of the Late Paleo Period was heralded by numerous technological and cultural innovations that appeared throughout the Archaic Period. These innovations may be best explained in relation to the dynamic nature of the post-glacial environment and region-wide population increases.

Archaic Period

During the Early Archaic Period (9950 – 7950 BP), the jack and red pine forests that characterized the Late Paleo environment were replaced by forests dominated by white pine with some associated deciduous trees (Ellis et al.1990: 68-69). One of the more notable changes in the Early Archaic Period is the appearance of side and corner-notched projectile points. Other significant innovations include the introduction of ground stone tools such as celts and axes, suggesting the beginnings of a simple woodworking industry. The presence of these often large and not easily portable tools suggests there may have been some reduction in the degree of seasonal movement, although it is still suspected that population densities were quite low, and band territories large.

During the Middle Archaic Period (7950 – 4450 BP) the trend to more diverse toolkits continued, as the presence of net-sinkers suggest that fishing was becoming an important aspect of the subsistence economy. It was also at this time that "bannerstones" were first manufactured.

Bannerstones are carefully crafted ground stone devices that served as a counterbalance for atlatls or spear-throwers. Another characteristic of the Middle Archaic is an increased reliance on local, often poor-quality chert resources for the manufacturing of projectile points. It seems that during earlier periods, when groups occupied large territories, it was possible for them to visit a primary outcrop of high-quality chert at least once during their seasonal round. However, during the Middle Archaic, groups inhabited smaller territories that often did not encompass a source of high-quality raw material. In these instances, lower quality materials which had been deposited by the glaciers in the local till and river gravels were utilized.

This reduction in territory size was probably the result of gradual region-wide population growth which led to the infilling of the landscape. This process forced a reorganization of Indigenous subsistence practices, as more people had to be supported from the resources of a smaller area. During the latter part of the Middle Archaic, technological innovations such as fish weirs have been documented as well as stone tools especially designed for the preparation of wild plant foods.

It is also during the latter part of the Middle Archaic Period that long-distance trade routes began to develop, spanning the northeastern part of the continent. In particular, native copper tools manufactured from a source located northwest of Lake Superior were being widely traded (Ellis et al.1990: 66). By 5450 BP the local environment had stabilized in a near modern form (Ellis et al. 1990: 69).

During the Late Archaic (4450 – 2900 BP) the trend towards decreased territory size and a broadening subsistence base continued. Late Archaic sites are far more numerous than either Early or Middle Archaic sites, and it seems that the local population had definitely expanded. It is during the Late Archaic that the first formal cemeteries appear. Before this time individuals were interred close to the location where they died. During the Late Archaic, if an individual died while his or her group happened to be at some distance from their group cemetery, the bones would be kept until they could be placed in the cemetery. Consequently, it is not unusual to find disarticulated skeletons, or even skeletons lacking minor elements such as fingers, toes or ribs, in Late Archaic burial pits.

The appearance of formal cemeteries during the Late Archaic has been interpreted as a response to increased population densities and competition between local groups for access to resources. It is argued that cemeteries would have provided strong symbolic claims over a local territory and its resources. These cemeteries are often located on heights of well-drained sandy/gravel soils adjacent to major watercourses.

This suggestion of increased territoriality is also consistent with the regionalized variation present in Late Archaic projectile point styles. It was during the Late Archaic that distinct local styles of projectile points appear. Also, during the Late Archaic the trade networks which had been established during the Middle Archaic continued to flourish. Native copper from northern Ontario and marine shell artifacts from as far away as the Mid-Atlantic coast are frequently encountered as grave goods. Other artifacts such as polished stone pipes and banded slate gorgets also appear on Late Archaic sites. One of the more unusual and interesting of the Late Archaic artifacts is the birdstone. Birdstones are small, bird-like effigies usually manufactured from green banded slate.

Woodland Period

The Early Woodland Period (2900 – 2350 BP) is distinguished from the Late Archaic Period primarily by the addition of ceramic technology. While the introduction of pottery provides a useful demarcation point for archaeologists, it may have made less difference in the lives of the Early Woodland peoples. The first pots were thick walled and friable. It has been suggested that they were used in the processing of nut oils by boiling crushed nut fragments in water and skimming off the oil. These vessels were not easily portable, and individual pots must not have enjoyed a long use life. There have also been numerous Early Woodland sites located at which no pottery was found, suggesting that ceramic vessels had yet to assume a central position in the day-to-day lives of Early Woodland peoples.

Other than the introduction of this limited ceramic technology, the lifeways of Early Woodland peoples show a great deal of continuity with the preceding Late Archaic Period. For instance, birdstones continue to be manufactured, although the Early Woodland varieties have "pop-eyes" which protrude from the sides of their heads.

Likewise, the thin, well-made projectile points which were produced during the terminal part of the Archaic Period continue in use. However, the Early Woodland variants were side-notched rather than corner-notched, giving them a slightly altered and distinctive appearance.

The trade networks which were established in the Middle and Late Archaic also continued to function, although there does not appear to have been as much traffic in marine shell during the Early Woodland Period. During the last 200 years of the Early Woodland Period, projectile points manufactured from high quality raw materials from the American Midwest begin to appear on sites in southwestern Ontario.

In terms of settlement and subsistence patterns, the Middle Woodland (2350 – 1400 BP) provides a major point of departure from the Archaic and Early Woodland Periods. While Middle Woodland peoples still relied on hunting and gathering to meet their subsistence requirements, fish were becoming an even more important part of the diet.

In addition, Middle Woodland peoples relied much more extensively on ceramic technology. Middle Woodland vessels are often heavily decorated with hastily impressed designs covering the entire exterior surface and upper portion of the vessel interior. Consequently, even very small fragments of Middle Woodland vessels are easily identifiable.

It is also at the beginning of the Middle Woodland Period that rich, densely occupied sites appear along the margins of major rivers and lakes. While these areas had been utilized by earlier peoples, Middle Woodland sites are significantly different in that the same location was occupied off and on for as long as several hundred years and large deposits of artifacts often accumulated. Unlike earlier seasonally utilized locations, these Middle Woodland sites appear to have functioned as base camps, occupied off and on over the course of the year. There are also numerous small upland Middle Woodland sites, many of which can be interpreted as special purpose camps from which localized resource patches were exploited. This shift towards a greater degree of sedentism continues the trend witnessed from at least Middle Archaic times and provides a prelude to the developments that follow during the Late Woodland Period.

The Late Woodland Period began with a shift in settlement and subsistence patterns involving an increasing reliance on corn horticulture (Fox 1990: 185; Smith 1990; Williamson 1990: 312). Corn may have been introduced into southwestern Ontario from the American Midwest as early as 1500 BP or a few centuries before. Corn did not become a dietary staple, however, until at least three to four hundred years later, and then the cultivation of corn gradually spread into south-central and southeastern Ontario.

During the early Late Woodland, particularly within the Princess Point Complex (circa 1450 – 900 BP), a number of archaeological material changes have been noted: the appearance of triangular projectile point styles, first seen during this period begin with the Levanna form; cord-wrapped stick decorated ceramics using the paddle and anvil forming technique replace the mainly coil-manufactured and dentate stamped and pseudo-scallop shell impressed ceramics; and if not appearance, increasing use of maize (Zea mays) as a food source (e.g., Bursey 1995; Crawford et al. 1997; Ferris and Spence 1995: 103; Martin 2004 [2007]; Ritchie 1971: 31-32; Spence et al. 1990; Williamson 1990: 299).

The Late Woodland Period is widely accepted as the beginning of agricultural life ways in south-central Ontario. Researchers have suggested that a warming trend during this time may have encouraged the spread of maize into southern Ontario, providing a greater number of frost-free days (Stothers and Yarnell 1977). Further, shifts in the location of sites have also been identified with an emphasis on riverine, lacustrine and wetland occupations set against a more diffuse use of the landscape during the Middle Woodland (Dieterman 2001).

The first agricultural villages in southern Ontario date to the 10th century. Unlike the riverine base camps of the Middle Woodland Period, these sites are located in the uplands, on well-drained sandy soils. Village sites dating between 1050 – 650 BP share many attributes with the historically reported Late Woodland sites, including the presence of longhouses and sometimes palisades. However, these early longhouses were not all that large, averaging only 12.4 metres in length (Dodd et al. 1990: 349; Williamson 1990: 304-305). It is also quite common to find the outlines of overlapping house structures, suggesting that these villages were occupied long enough to necessitate re-building.

The Jesuits reported that the Huron moved their villages once every 10-15 years, when the nearby soils had been depleted by farming and conveniently collected firewood grew scarce (Pearce 2010). It seems likely that Early Late Woodland peoples occupied their villages for considerably longer, as they relied less heavily on corn than did later groups, and their villages were much smaller, placing less demand on nearby resources.

Judging by the presence of carbonized corn kernels and cob fragments recovered from sub-floor storage pits, agriculture was becoming a vital part of the Early Late Woodland economy. However, it had not reached the level of importance it would in the Middle Late and Late Woodland Periods. There is ample evidence to suggest that more traditional resources continued to be exploited and comprised a large part of the subsistence economy. Seasonally occupied special purpose sites relating to deer procurement, nut collection, and fishing activities, have all been identified. While beans are known to have been cultivated later in the Late Woodland Period, they have yet to be identified on Early Late Woodland sites.

The Middle Late Woodland Period (650 – 550 BP) witnessed several interesting developments in terms of settlement patterns and artifact assemblages. Changes in ceramic styles have been carefully documented, allowing the placement of sites in the first or second half of this 100-year period. Moreover, villages, which averaged approximately 0.6 ha in extent during the Early Late Woodland Period, now consistently range between 1 and 2 ha.

House lengths also change dramatically, more than doubling to an average of 30 m, while houses of up to 45 m have been documented. This increase in longhouse length has been variously interpreted. The simplest possibility is that increased house length is the result of a gradual, natural increase in population (Dodd et al. 1990: 323, 350, 357; Smith 1990). However, this does not account for the sudden shift in longhouse lengths around 650 BP. Other possible explanations involve changes in economic and socio-political organization (Dodd et al. 1990: 357).

One suggestion is that during the middle Late Woodland Period small villages were amalgamating to form larger communities for mutual defense (Dodd et al. 1990, p. 357). If this was the case, the more successful military leaders may have been able to absorb some of the smaller family groups into their households, thereby requiring longer structures. This hypothesis draws support from the fact that some sites had up to seven rows of palisades, indicating at least an occasional need for strong defensive measures. There are, however, other middle Late Woodland villages which had no palisades present (Dodd et al. 1990). More research is required to evaluate these competing interpretations.

The lay-out of houses within villages also changes dramatically by 650 BP. During the early Late Woodland Period villages were haphazardly planned, with houses oriented in various directions. During the Middle Late Woodland Period villages are organized into two or more discrete groups of tightly spaced, parallel aligned, longhouses. It has been suggested that this change in village organization may indicate the initial development of the clans which were a characteristic of the historically known Iroquoian peoples (Dodd et al. 1990: 358).

Initially at least, the late Late Woodland Period (550 – 350 BP) continues many of the trends which have been documented for the proceeding century. For instance, between 500 and 450 BP house lengths continue to grow, reaching an average length of 62 m. One longhouse excavated on a site southwest of Kitchener was an incredible 123 m (Lennox and Fitzgerald 1990: 444-445). After 450 BP, house lengths begin to decrease, with houses dating between 400 – 320 BP averaging 30 m in length.

Why house lengths decrease after 450 BP is poorly understood, although it is believed that the even shorter houses witnessed on historical period sites can be at least partially attributed to the population reductions associated with the introduction of European diseases such as smallpox (Lennox and Fitzgerald 1990:405, 410). Village size also continues to expand throughout the late Late Woodland Period, with many of the larger villages showing signs of periodic expansions. The latter part of the middle Late Woodland Period and the first century of the late Late Woodland Period was a time of village amalgamation. One large village situated just north of Toronto has been shown to have expanded on no fewer than five occasions. These large villages were often heavily defended with numerous rows of wooden palisades, suggesting that defence may have been one of the rationales for smaller groups banding together. Late Late Woodland village expansion has been clearly documented at several sites throughout southwestern and south-central Ontario. The excavations at the Lawson site, a large village located in southwestern Ontario, has shown that the original village was expanded by at least twenty percent to accommodate the construction of nine additional longhouses (Anderson 2009).

1.3.2 Post-Contact Regional History

Following European settlement in North America, the nature of Indigenous settlement size, population distribution, and material culture shifted as settlers began to colonize the land. Despite this shift in Indigenous life ways, “written accounts of material life and livelihood, the correlation of historically recorded villages to their archaeological manifestations, and the similarities of those sites to more ancient sites have revealed an antiquity to documented cultural expressions that confirms a deep historical continuity to Iroquoian systems of ideology and thought” (Ferris 2009: 114). As a result, Indigenous peoples of southern Ontario have left behind archaeologically significant resources throughout southern Ontario which show continuity with past peoples, even if this connection has not been recorded in historical Euro-Canadian documentation.

The Study Area is situated within the former Toronto Township, County of Peel, now City of Mississauga, Regional Municipality of Peel, Ontario. This geographic area was inhabited by the Mississauga First Nation at the time of initial Euro-Canadian contact. This nation subsequently ceded lands to Chief Joseph Brant and the Crown through four separate treaties from 1805 to 1820 (Morris 1943: 22-25). The course and details of these events are summarized briefly below:

- *Treaty No. 13A (The First Purchase):* August 2, 1805 – This treaty comprises the fronts of the Townships of Toronto, Trafalgar and Nelson, except the 3,450 acres granted to Chief Joseph Brant in 1797. It includes 74,000 acres of land excluding a one-mile strip on each side of the Credit River from the waterfront to the base line (modern Eglinton Avenue), which was the Credit Indian Reserve (Heritage Mississauga 2009). It is described as follows (Morris 1943: 22):

  > *Commencing at the eastern bank of the mouth of the River Etobicoke, being in the limit of the western boundary line of the Toronto Purchase, in the year 1787; then north twenty-two degrees west, six miles; thence south 38 degrees west, twenty-six miles more or less, until it intersects a line on the course north 45 degrees west, produced from the outlet of Burlington Bay; then along the said produced line, one mile more or less to the lands granted to Captain Brant; then north 45 degrees east, one mile and a half; then south 45 degrees east, three miles and a half more or less to Lake Ontario; then north easterly along the waters edge of Lake Ontario to the eastern bank of the River Etobicoke being the place of beginning.*

- *Treaty No. 19 (The Second Purchase)*: October 28, 1818 – An agreement reached by the Principal Men of the Mississauga Nation of Indians, inhabiting the River Credit, and Twelve- and Sixteen-Mile Creeks on the north Shore of Lake Ontario. Over 600,000 acres of land, representing most of what is known today as the Region of Peel, were surrendered (Heritage Mississauga 2009). The tract of land was described as follows (Morris 1943: 24):

  > *A tract of land in the Home District called the Mississague Tract, bounded southerly by the purchase made in 1806; on the east by the Townships of Etobicoke, Vaughan and King; on the south west by the Indian Purchase, extending from the outlet of Burlington Bay, north forty-five degrees west, fifty miles; and from thence north seventy-four degrees east or thereabouts, to the north west angle of the Township of King.*

- *Treaty No. 22*: February 28, 1820 – ". . . the Principal Chiefs, Warriors and People of the Mississauga Nation transferred to His Majesty George the Third for the sum of 20 shillings, parts of those tracts of land at Credit River, Sixteen Mile Creek and Twelve Mile Creek, formerly reserved in Treaty 13A . . ." (Morris 1943: 25).

- *Treaty No. 23*: February 28, 1820 – "… the Principal chiefs, Warriors and People of the Mississauga Nation, transferred to His Majesty George the Third for the sum of 50 pounds, parts of those tracts of land at Credit River, Sixteen Mile Creek, and Twelve Mile Creek, formerly reserved in 13A . . ." (Morris 1943: 25).

By 1821, the Mississauga First Nation had surrendered most of the Credit Indian Reserve lands set aside in 1805 in the final two "Credit Treaties." In 1847, the remaining members of the Mississaugas relocated to the New Credit Reserve (now Mississaugas of the Credit First Nation) in Hagersville (Heritage Mississauga 2009). The geographic area now known as the City of Mississauga has since been farmed, settled and developed by families and communities of European descent.

1.3.3 Toronto Township, Peel County

Toronto Township was established during the "Old Survey" of 1806 following the signing of Treaty 13A (Heritage Mississauga 2009); this survey established the southern half of the township (Riendeau 1985: 23). Just over a decade later, after the signing of Treaty 19, the "New Survey" of the area, which occurred in 1819, divided the acquired lands into the Townships of Toronto, Chinguacousy, Caledon, Albion and Toronto Gore (Heritage Mississauga 2009); this survey established the northern half of the Township (Riendeau 1985: 23). Toronto Township was incorporated in 1850 as a primarily rural society (City of Mississauga 2004).

Peel County and its townships were originally settled by British soldiers and their families, many of whom served with the Queen's Rangers, during the late 18th century and into the early 19th century (Bull 1935).
As the number of farmsteads and homesteads within the county grew, several villages and communities were established. Those that thrived into the 20th century and were amalgamated into the City of Mississauga in 1974 include: Clarkson, Cooksville, Dixie, Erindale, Malton, Meadowvale, Port Credit and Streetsville (Heritage Mississauga 2009). These villages assisted in the processing of local natural resources including lumber, grain and other farm products (City of Mississauga 2004). Port Credit, Streetsville and Meadowvale thrived early on given their location on the Credit River, a transportation route and the site of several lumber and grist mills (City of Mississauga 2004).

With the establishment of military headquarters at York, there was a need to develop and maintain reliable ground transportation routes for provisioning both soldiers and supplies throughout Upper Canada. Dundas Street was the first major "highway" constructed in the region, by military engineers (Bull 1935). This main transportation route was subsequently used by various Loyalist settlers following the surveying and establishment of new townships and communities. The existing forests were cut down for the growing of crops and the raising of livestock.

The arrangement of people within Toronto Township changed once again in the mid-19th century with the establishment of the railways. This influenced the development of southern villages including Clarkson and Lorne Park which were affiliated with the Great Western Railway and northern villages such as Malton, which was affiliated with the Grand Trunk Railway (City of Mississauga 2004).

1.3.3.1 Missinnihe/Credit River

The water source known as present-day Credit River was named Missinnihe ("trusting creek") by the Mississaugas. The Mississaugas used the river and its surrounding area for hunting, fishing, gathering, healing, and spiritual purposes (MCFN 2018). A trading post was established at the mouth of the river by the French in the 18th century, which enabled the trade of pelts gathered over the winter for European goods.

The Missinnihe was renamed the Rivière au Crédit by the French, which translated to Credit River, and referred to the traders' practice of extending credit to the Mississaugas in the fall and then being repaid the following spring with the winter's catch of furs. The Mississaugas located at the western end of the lake became known to the Europeans as the Mississaugas of the Credit.

1.3.3.2 Port Credit

Old Port Credit Village was first formally surveyed in 1834, and the first sale of lots being held at a public auction in Toronto in 1835 (Smith 1846: 148). By 1842, a post office was established in the village, at which time the name of the community "officially" became Port Credit. The name had been in use since at least 1835, or slightly before that time (Walton 1837; Rayburn 1997: 276; Scott 1997: 182).

Plans for a formal harbour at Port Credit date back to March 1828, when an act was passed by the government of Upper Canada for the construction of a harbour at the nearby Sixteen Mile Creek in Oakville (9 Geo. IV c. 19). Further legislation was passed in March 1834, which incorporated the "Credit Harbour Company" as a joint-stock company, and provided for a loan to assist with the work then in progress. The work of improving the harbour was undertaken at an estimated cost of £2,500. The Mississaugas acquired a 2/3 interest in this company. Work on the harbour was contracted to E.W. Thomson, and harbour tolls were collected to recoup the investment (Smith 1851: 276; Smith 1987: 157; Robb 2003 9).

During the mid-1840s, a large quantity of farm produce and timber was shipped from Port Credit. The primary goods shipped from Port Credit in 1844 included: wheat, flour, pork, ashes, whiskey, timothy seed, wool, lumber, and oak and pine “squared timber.” As late as 1876, it was recorded that Clarkson and Chisholm bought and shipped 100,000 bushels of wheat from the harbour at Port Credit (Smith 1846: 149; Kirkwood 1967: 257). The population at this time reached 150, and the village had a Methodist church, blacksmith shop, schoolhouse, post office, and other small businesses.

Shipbuilding is said to have been carried on at the mouth of the Credit as early as 1809, but it became a major industry there by the 1840s. Five schooners “of a good class” were then owned by local merchants and businessmen. The community was linked by steamer service to Toronto and Hamilton in the period before the advent of the railways (Smith 1846: 149; Gibson 2002: 180).

By 1851, the population of the village had increased to about 200 inhabitants. It was described as the “shipping place for a large extent of fertile and well-cultivated country” (Smith 1851:276). In 1857, the population of Port Credit had reached 400 inhabitants, and many of the families were connected to the shipbuilding trade. The introduction of the Great Western Railway (GWR) to the area aided communication and travel from Port Credit to both Toronto and Hamilton, however, it also diverted a portion of the shipping activity away from the harbour (Riendeau 1985). The Port Credit rail station was opened in December 1855, near Stavebank Road. (Clarkson 1967). In 1855, the harbour suffered from a fire, causing the shipping activity to be further affected. By the mid-1860s, the population decreased to 350.

The harbour in 1851 was still bordered “by a considerable breadth of marsh” (Smith 1851:276). At that time, a new bridge was under construction. It was considered a necessary work, “the old bridge having been for years in a dangerous state” (Smith 1851: 276). The first wooden bridge at the mouth of the Credit was built in 1820. It was replaced by a second structure of timber truss construction, erected in 1832 at a cost of £50 by local merchants Chisholm and Gamble. This bridge was damaged in a flood in 1850 and replaced by another wooden one that was under construction in 1851. It stood until September 1895, when it was washed away in a storm and later replaced by an “iron bridge”. This bridge was replaced by concrete, bow-string structure in 1919. The concrete bridge is known to have remained in use until at least 1949, but it had been replaced by a more modern, four-lane, concrete structure in 1960-61 (Kirkwood 1967: 257; Gibson 2002: 181; Robb 2003: 23; Hicks 2007: xxxiv-xxxv).

During the 1850s, the “Lake Road” was purchased by the Toronto Road Company, which collected tolls and was responsible for its maintenance. Between 1914 and 1917, Lakeshore Road was cemented under the supervision of the Toronto-Hamilton Highway Commission. It became known as Highway 2 upon the completion of the work on the entire length of this road in 1922 (Gibson 2002: 188; Hicks 2007: xxviii).

By the close of the 19th century, the St. Lawrence Starch Company had located here, as well as a few brickyards. During the 20th century, a few oil refineries also located in the area which provided additional employment opportunities for the village.

By 1900, the population had increased to 650, making Port Credit the largest village in Toronto Township (Riendeau 1985). In 1909, Port Credit became a Police Village as its population had reached 750 residents, and by 1914, Port Credit incorporated as a Village. By 1945, the population of the village had reached 2,325, and it was elevated to a town by an act of the Provincial legislature in 1961. At that time, its population had increased by over 6,500. It was annexed to the City of Mississauga in 1974 (Kirkwood 1967: 258; Rayburn 1997: 276; Gibson 2002: 188; Robb 2003: 17).

1.3.4 Study Area History

A review of the 1859 Historical County Map of Peel County (Tremaine 1859) (Map 3) identifies the Study Areas in relation to the Port Credit Town Plot. A railway is located adjacent to Study Area 4. In 1859, Study Area's 1-3 are located within lands owned by R. & J. Cotton which are adjacent to Lake Ontario. Robert Cotton owned the lands west of the railway where Study Areas 4 and 5 are situated (Tremaine 1859).

The 1877 Map of the Township of Toronto (Walker & Miles 1877) (Map 4) shows Study Areas 1-3 to reside within the lands of Robert Cotton Esq. while Study Areas 4 and 5 reside within the lands of James W. Cotton, who is shown to own the land to the west of the railway.

Robert Cotton emigrated from Ireland to Canada in 1837 where he became a well-known merchant and farmer in Toronto Township (Canadian Historic Places ND). Cotton held several offices in the community including the Justice of Peace in 1850. Cotton purchased land on the west side of Old River Road and had a house built in 1856 (Canadian Historic Places ND). Upon his death in 1885, Robert Cotton transferred the Cotton Homestead to James W. Cotton, his brother. James worked alongside Robert as a postmaster, storemaster and was the owner of a Wharf. The Cotton brothers are considered to be the "Fathers" of Port Credit (Canadian Historic Places ND).

Aerial photographs (Map 5) show the history of the development of the Study Area from the mid-20th century onward. In 1954, the Study Areas 1 and 2 are located within commercial and industrial areas and Study Areas 3-5 are located within undeveloped parkland and agricultural fields. By 1966, the mouth of the Credit River has been substantially altered by the construction of the Port Credit Harbour Marina. Study Areas 1 and 2, which are adjacent to the Elmwood SPS, within the present Tall Oaks Park, appears to have been redeveloped from industrial to residential and parkland during the late 1990s. Study Area 3, located adjacent to the Hiawatha SPS within the current Hiawatha Park does not appear to have undergone significant alterations since the 1950s. Study Area 4, which is adjacent to the Rosemere SPS shows no significant landscape alterations other than the construction of the station. Study Area 5 does not show any significant landscape alterations since the 1950s.

1.4 Archaeological Context

1.4.1 Study Area Environment

The Study Areas are located within the City of Mississauga on the north shore of Lake Ontario. They are situated within the Iroquois Plain physiography region which extends from the western part of Lake Ontario to the Trent River (Chapman and Putnam 1984: 190). The Iroquois Plain physiography region was formed during the last Glaciation when the region was covered by a water body known as Lake Iroquois. Its width varies from several hundred meters up to 13 km. This plain is the remnant shoreline of glacial Lake Iroquois and was smoothed over time by wave action and lacustrine deposits. Now this physiographic region is composed of a thin veneer of glacio-lacustrine sand and silty sand. These sandy soils once supported forests, savannahs, and prairies, populated by species of the Carolinian Ecoregion at close to their northern extent. The Iroquois Plain was a general farming area, with a tendency for horticulture and growth of canning crops. Since World War II, the remaining farms have become larger while much of the land has been put to urban uses.

The surficial geology consists of interbedded flow till in Study Areas 1-3, and foreshore basin deposits entirely within Study Areas 4 and 5 (Map 6).

1.4.2 Previous Archaeological Assessments

Several Archaeological Assessments have previously been conducted within 50 m of the Study Area (Map 7).

ASI conducted Stage 1 and 2 Archaeological Assessment along Mona Road which resulted in the discovery of AjGv-83, an Archaic and Woodland campsite (ASI 2016a; 2016b). The site was subsequently subject to Stage 3 Archaeological Assessment and Stage 4 Mitigation, where by it was fully documented and excavated and concluded to have no further cultural heritage value or interest (ASI 2016c; 2016d). This archaeological work took place approximately 50 m northeast of the current Study Area 4 and adjacent to the current Study Area 5.

In 2017, ASI (2017) undertook a Stage 1 Archaeological Assessment for three SPS upgrades, one of which was the Rosemere SPS. Portions of the Rosemere Road Study Area assessed by ASI were identified as having archaeological potential and recommended for Stage 2 Archaeological Assessment. The Stage 2 Archaeological Assessment found the entire Rosemere SPS Study Area was disturbed and made the following recommendations (ASI 2018:i):

1) *The Study Area for the Mississauga Sewage Pumping Station Upgrades, including the Rosemere Road, Indian Road, and Silver Birch Trail sewage pumping stations, has been fully documented, and no further archaeological assessment is required on these lands; and*

2) *Should the proposed work extend beyond the current Study Area, further archaeological assessment must be conducted to determine the archaeological potential of the surrounding lands.*

The Stage 1 and 2 Archaeological Assessments completed by ASI overlap with the eastern portion of Study Area 4.

In 2018, 4Transit, a joint venture of Hatch, Parsons, and WSP, conducted a Stage 1 Archaeological Assessment as part of the Building Rehab & Elevator Replacement – Port Credit and Port Credit GO Station Parking Structure Joint Development (2018). The Stage 1 Archaeological Assessment determined parts of the project area have archaeological potential requiring a Stage 2 Archaeological Assessment. The western limits of the area assessed as part of the Stage 1 Archaeological Assessment is located approximately 17 m southeast of Study Area 4 and approximately 43 m southeast of Study Area 5.

In 2020, Golder Associates Ltd., now WSP Canada Inc, conducted a Stage 1 Archaeological Assessments as part of a Schedule ‘C’ Municipal Class Environmental Assessment for the proposed Port Credit East Water and Wastewater Servicing Optimization EA (Golder 2021a). The Stage 1 Archaeological Assessments determined portions of the Study Area to have archaeological potential requiring Stage 2 Archaeological Assessment and made the following recommendations:

1) *Stage 2 archaeological assessment is required for the portion of the study area that retains archaeological potential as shown on Map 9. The stage 2 archaeological assessment should be a test pit survey at 5 m intervals following the standards outlined in Section 2.1.2 of the MHSTCI’s (2011) Standards and Guidelines.*

2) *As per Standard 1f of Section 1.4.1 (MHSTCI 2011), no additional archaeological assessment is required for the areas identified as disturbed on Map 9.*

3) *Should development impacts extend beyond the project study area, additional archaeological assessment may be required.*

In 2023, WSP completed a Stage 1 archaeological assessment for 7 additional areas added to the project. WSP (2023) made the following recommendations:

1) *Lands that have been previously subjected to Archaeological Assessment(s) and cleared by the MCM of further archaeological concern are recommended to be exempt from further Archaeological Assessment.*

    a) *The portion of Study Area 4 that consists of the Rosemere SPS was previously assessed and no further assessment was recommended for that area (ASI 2017; Map 9D).*

b) Study Area 7 has been previously assessed and no further assessment was recommended for that area (WSP 2018; Map 9G).

2) The Stage 1 Archaeological Assessment has determined there is potential for the identification of archaeological resources within portions of the Study Area:

a) Study Area 1; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9A).

b) Study Area 4; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9D).

c) Study Area 6; Stage 2 test pit survey is recommended within a portion of the Study Area (Map 9F).

Stage 2 test pit survey at 5 m intervals is recommended for these areas prior to ground disturbance activities in accordance with Section 2.1.2 of the MCM's Standards and Guidelines for Consultant Archaeologists (2011). Test pits should be 30 cm in diameter and hand excavated 5 cm into sterile subsoil. If artifacts are recovered their location should be recorded with a GPS unit and test pit intervals reduced to 2.5 m within 5 m of the positive test pit, as well as a 1 m test unit if necessary.

3) Areas of previous disturbance were identified in portions of the Study Area. These areas of disturbance include parking lots, sidewalks/paved public spaces, and landscape design areas (i.e. gardens, grass boulevards) or past disturbance documented in historical aerial photographs. The Stage 1 Archaeological Assessment property inspection determined there is low potential for the identification of archaeological resources in portions of the Study Area:

a) Study Area 1; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9A).

b) Study Area 2; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9B).

c) Study Area 3; Low archaeological potential within Study Area; no further Archaeological Assessment is recommended (Map 9C).

d) Study Area 4; Low archaeological potential within portions of the Study Area; no further Archaeological Assessment is recommended for these areas (Map 9D).

e) Study Area 5; Low archaeological potential within the entire Study Area; no further Archaeological Assessment is recommended for these areas (Map 9E).

1.4.3 Registered Archaeological Sites

The Ontario Archaeological Sites Database (OASD) was consulted on November 16, 2022, and it was determined that there are 23 registered archaeological sites located within 1 km of the greater Study Area (Table 2). Of the 23 archaeological sites, two are located within 300 m of Study Area 4, with one located within 300 m of Study Area 5.

Table 2: Registered Archaeological Sites within 1 km of the Study Area

Borden Number	Name	Time Period	Cultural Affiliation	Site Type	Current Development Review Status	Study Area within 1 km
AjGv-1*	Hare	Pre-Contact	Archaic, Woodland, Middle	Campsite	Further CHVI	1, 2, 4, 5
AjGv-4	Stillmeadow	Pre-Contact	Woodland	Camp/campsite	Further CHVI	4, 5
AjGv-5	Glenburny	Pre-Contact	Indigenous	Campsite	No further CHVI	1, 2, 4, 5
AjGv-8	Eley	Pre-Contact	Archaic	Campsite	Further CHVI	1, 2, 4, 5
AjGv-9	Avonbridge	Pre-Contact	Archaic	Campsite	No further CHVI	1, 2, 4, 5
AjGv-10	Stavebank	–	–	–	No further CHVI	1, 2, 4, 5
AjGv-11	Port Street	–	–	–	No further CHVI	1, 2, 4, 5
AjGv-12	Pinewood Trail	–	–	–	–	5
AjGv-13	Fort Toronto	Post-Contact	Mississauga	Village	No further CHVI	4, 5
AjGv-17	Nunan	–	–	–	–	5
AjGv-32	Scott-O'Brien	Pre-Contact	Archaic, Middle, Woodland, Early, Woodland, Middle	–	–	4, 5
AjGv-39	Adamson Estate	Post-Contact	Euro-Canadian	Homestead, other buildings	Further CHVI	1, 2, 3
AjGv-46	–	Pre-Contact	Indigenous	Findspot	–	5
AjGv-47	–	Pre-Contact	Indigenous	Findspot	–	5
AjGv-48	–	Pre-Contact	Indigenous	Findspot	–	5
AjGv-50	Atoka	Pre-Contact	Woodland, Early, Woodland, Middle	Scatter	–	5
AjGv-57	Rewa	Pre-Contact	Woodland, Middle	Burial	Further CHVI	4, 5
AjGv-71	James Taylor	Post-Contact	Euro-Canadian	Warehouse	Further CHVI	1, 2, 4, 5
AjGv-73	AjGv-73	Pre-Contact	Woodland, Middle	Scatter	Further CHVI	4, 5
AjGv-74	AjGv-74	Pre-Contact	Woodland	Short term	Further CHVI	4, 5
AjGv-75	AjGv-75	Pre-Contact	Indigenous	Scatter	No further CHVI	4, 5
AjGv-83**	AjGv-083	Pre-Contact	Archaic, Late Archaic, Middle, Woodland	Camp/campsite	Further CHVI	1, 2, 4, 5
AjGv-84	Kane	Post-Contact	Woodland	Unknown	Further CHVI	4, 5
AjGv-95	Tall Oaks	Pre-Contact	Indigenous	Scatter	Further CHVI	2, 3, 4, 5

– *denotes information was not available on the OASD*
* *denotes site within 300 m of Study Area 4*
** *denotes site within 300 m of Study Area 4 and 5*

The site form on the OASD states that AjGv-1 (Hare) was identified as a pre-contact Indigenous campsite in 1971. The site is located on the bank of the Credit River and has been dated to the Archaic (Laurentian) and Middle Woodland periods. AjGv-1 (Hare) consists of an unknown amount of ceramic material and lithics. It was believed to have been destroyed by development. However, a further investigation by York University found evidence of ceramic material and lithics which proves the site is not destroyed and retains some cultural heritage value or interest. The site is located approximately 200 m west of Study Area 4.

AjGv-83 was identified through Stage 2 test pit survey in 2016 by ASI under PIF no. P046-0158-2016 (ASI 2016b). The site consisted of Indigenous artifacts within an area measuring 5 m by 2 m. The site was subjected to Stage 3 test unit excavation under PIF no. P223-0103-2016 and resulted in the recovery of 61 artifacts in an area measuring 20 m by 15 m (ASI 2016b). The site was recommended for Stage 4 archaeological mitigation, which was also completed in 2016 and which resulted in an additional 832 artifacts being recovered in an area measuring 40 m by 40 m (ASI 2016b). Based on the features uncovered and the artifacts recovered, AjGv-83 is identified as Middle to Late Archaic and Woodland campsite. While the site within the project area underwent full mitigation under PIF no. P223-0107-2016, it was noted in the site record that the MCM concluded the site may extend beyond the subject property ASI investigated and therefore may still have further cultural heritage value or interest. The site is located approximately 100 m north of Study Area 4 and approximately 130 m west of Study Area 5.

1.4.4 Cultural Heritage Resources

According to the City of Mississauga's *Heritage Designation Properties* gallery (2020), the City of Mississauga's *Heritage Register* (2018), the City of Mississauga's *Cultural Heritage Landscape Inventory* (2005), the City of Mississauga's *Cultural Heritage Landscape Project* (ND), and re-utilizing research from a Stage 1 Archaeological Assessment report obtained during a consultation with heritage planning staff at the City of Mississauga, three protected heritage properties designated under Part IV of the *Ontario Heritage Act*, and two cultural heritage landscapes listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes* are within the Study Area or within 300 m of its boundaries (Table 3; Map 8). Per Section 1.3 and 1.4 of the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011), property listed on a municipal register or designated under the *Ontario Heritage Act* or that is a federal, provincial, or municipal historic landmark or site is indicative of archaeological potential.

Table 3: Known Cultural Heritage Resources within 300 m of the Study Area

Civic Address or Location	Description	Cultural Heritage Status	Study Area within or within 300 m
40 Stavebank Road	Port Credit Memorial Arena, constructed 1959	Protected heritage property designated under Part IV of the *OHA* (By-law 261-2011)	4, 5
29 Stavebank Road North	Cenotaph Park, Cenotaph constructed in 1925	Protected heritage property designated under Part IV of the *OHA* (By-law 118-84)	4, 5
Old Port Credit	Located west of the Credit River and straddling Lakeshore Road	Listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*	4, 5
141 Lakeshore Road East	St. Lawrence Starch Limited Administration Building, constructed in 1932	Protected heritage property designated under Part IV of the *OHA* (By-law 446-93)	1,2
Mineola Neighbourhood	Located north of Lakeshore Road bounded by the Credit River on the west and Hurontario on the east	Listed on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*	4, 5

2.0 FIELD METHODS

The Stage 2 Archaeological Assessment was conducted on November 8 and 9, 2021 and October 24, 2022, under the professional archaeological consulting licence P468 issued to Rhiannon Fisher of WSP (PIF: P468-0083-2021). WSP archaeological field supervisor Martha Tildesley (P399) acted as the licensed field director during the Stage 2 Archaeological Assessment as per *Section 12* of the MCM' *Terms and Conditions for Archaeological Licences*, issued in accordance with clause 48(4)(d) of the *Ontario Heritage Act*. The weather during the survey was mainly sunny with some cloud cover, slight breeze, and a temperature high of 16°C. The weather and lighting conditions during the Stage 2 fieldwork permitted good visibility of all parts of the Study Area and were conducive to the identification and recovery of archaeological resources.

The Stage 2 Archaeological Assessment employed strategies defined by the MCM in the 2011 *Standards and Guidelines for Consultant Archaeologists*. The overall Stage 2 Study Area encompassed five distinct areas. Study Areas 1 and 2 are within the current Tall Oaks Park. Study Area 1 is located within an open, manicured lawn with saplings and walking paths and is situated along the waterfront of Lake Ontario. Study Area 2 is located northeast of Study Area 1 and surrounds the Elmwood SPS building. The area consists of manicured lawns, large oak trees, a small overgrown brush area, walking paths and is also situated along the waterfront of Lake Ontario. Study Area 3 is also a park setting, within the current Hiawatha Park and consists of manicured lawns and large trees. Only a portion of the park was recommended for testing (Map 9). The Hiawatha SPS is located within the north western portion the Study Area. There is a walking path that runs from the road to the waterfront. Study Area 4 is a small, manicured lawn adjacent to the Rosemere SPS. The area is mostly sloped down toward the Kenollie Creek and up to the roadway. There is a small, flat grass area between the fence and the slope to the road. Study Area 5 is a small, manicured lawn located at the southeast end of Mona Road, adjacent to the roadway. Photo documentation of the Stage 2 fieldwork conducted within the Study Area is provided in Images 1-24 (pp. 29-40). and Map 10.

2.1 Study Area 1

The Study Area located within the current Tall Oaks Park is approximately 0.07 ha and was assessed by means of archaeological test pit survey. The test pit survey was conducted at 5 m intervals to start. However, the soils were not natural, and evidence of disturbance was identified above the natural subsoil. The test pit survey was then conducted at 10 m along survey transects as per *Section 2.1.8. Standard 2* (Image 1, p. 29). Each test pit was at least 30 cm in diameter and hand excavated by shovel and trowel. Where possible, test pits were excavated at least 5 cm into the subsoil which ranged in depth from 40 to 50 cm. Study Area 1 was observed to exhibit disturbance and amounts to 100% of the Study Area (Map 10A). The disturbed pits exhibited disturbance in the form of medium brown clay mottled with asphalt and gravel above yellow brown sandy loam (Image 2, p. 29) and irrigation pipes and sprinklers were found throughout (Image 3 and Image 4, p. 30). These areas were subject to test pit survey at 10 m intervals. Soil from all test pits was screened through a 6 mm hardware mesh to facilitate the identification and recovery of archaeological resources. All test pits were examined for stratigraphy, cultural features, and evidence of fill. Following excavation, all test pits were backfilled to original grade.

2.2 Study Area 2

Study Area 2 is approximately 0.34 ha and is located within the current Tall Oaks Park and surrounds the Elmwood SPS. This area consists of large oak trees, manicured lawns, an overgrown brush area, and a waterfront trail. The test pit survey involved the hand excavation of test pits every 5 m along survey transects spaced 5 m from each other creating a 5 m grid of test pits (Images 5 and 6, p. 31). Each test pit was at least 30 cm in diameter and hand excavated by shovel and trowel. Where possible, test pits were excavated at least 5 cm into the subsoil which ranged in depth from 24-34 cm. Portions of Study Area 2 were observed to exhibit

disturbance over natural subsoil and amounts to 30% (0.1 ha) of the Study Area (Image 7, p. 32; Map 10A). The remaining portion of Study Area 2 (0.24 ha) had a natural soil of medium brown sandy loam and the subsoil was a yellow-brown sandy loam (Image 8 and 9, pp. 32-33). The disturbed pits exhibited disturbance in the form of medium brown clay mottled with asphalt and gravel and were significantly deeper (~50 cm). These areas were subject to test pit survey at 10 m intervals as per *Section 2.1.8 Standard 2*. Areas of natural soil were subject to test pit survey at 5 m intervals. Soil from all test pits was screened through a 6 mm hardware mesh to facilitate the identification and recovery of archaeological resources. During the Stage 2 test pit survey, two findspots were found, Location 1 and Tall Oaks (AjGv-95). Location 1 had a single piece of Onondaga chert debitage in a positive test pit. When an artifact was recovered, the survey interval was maintained to determine the size of the artifact scatter and artifact recovery frequency. Recovered artifacts were inventoried by findspot locations and their location in 1983 North American Datum (NAD 83) coordinates were recorded in the field using a Garmin Etrex 10 handheld GPS with a minimal accuracy reading of 3 metres. Once the 5 m survey interval was completed, 8 test pits were excavated 2.5 m in each cardinal direction from the findspot, except for the northeast, east, and southeast test pits. These test pits were placed 1.5 m from the original positive test pit due to the location of a utility. A test unit was placed overtop of the original positive test pit (Image 10-11, pp. 33-34). The total depth was 24 cm, and zero artifacts were recovered. The second findspot, Tall Oaks (AjGv-95) consisted of 30 pieces of Onondaga chert debitage within a single positive test pit. When an artifact was recovered, the survey interval was maintained to determine the size of the artifact scatter and artifact recovery frequency. Recovered artifacts were inventoried by findspot locations and their location in 1983 North American Datum (NAD 83) coordinates were recorded in the field using a Garmin Etrex 10 handheld GPS with a minimal accuracy reading of 3 metres. As per *Section 2.2., Standards 1.a.ii (2)* of the MCM (2011), the recovery of at least 10 non-diagnostic pre-contact Indigenous artifacts within a 10 m by 10 m test pit survey area meets the criteria requiring Stage 3 Archaeological Assessment, therefore cardinal test pits and a test unit were not excavated. Following excavation, all test pits and units were backfilled to original grade.

2.3 Study Area 3

The Study Area located within the current Hiawatha Park is approximately 0.23 ha and was assessed by means of archaeological test pit survey. The test pit survey was conducted at 5 m intervals to start (Image 12, p. 34). However, the soils were not natural, and evidence of disturbance was identified over the natural subsoil. The test pit survey was then conducted at 10 m along survey transects as per *Section 2.1.8 Standard 2* (Image 13, p. 35). Each test pit was at least 30 cm in diameter and hand excavated by shovel and trowel. Where possible, test pits were excavated at least 5 cm into the subsoil which ranged in depth from 35 to 100 cm (Image 14-16, pp. 35-36). The entirety of Study Area 2 was observed to exhibit disturbance (Map 10B). The soil was a medium brown clay silt mottled with grey clay and subsoil was yellow-brown clay silt. Following excavation, all test pits were backfilled to original grade.

2.4 Study Area 4

The Study Area located adjacent to the Rosemere SPS is approximately 0.07 ha and was assessed by means of archaeological test pit survey. The test pit survey involved the hand excavation of test pits every 5 m along survey transects spaced 5 m from each other creating a 5 m grid of test pits (Image 17-18, p. 37). Each test pit was at least 30 cm in diameter and hand excavated by shovel and trowel. Where possible, test pits were excavated at least 5 cm into the subsoil which ranged in depth from 27-40 cm. There was a drainage pipe emptying into a low lying section and pits within this area filled with water and were too waterlogged, amounting to approximately 12% (0.008 ha) the Study Area (Image 19, p. 38). Test pit survey was moved to 10 m intervals as per *Section 2.1.8 Standard 2* when evidence of disturbance in the form of a medium brown clay with a yellow-brown subsoil mottled with grey clay throughout was revealed (Image 20-21, pp. 38-39). Previous assessments nearby indicated the

area had been affected by the construction of the Rosemere SPS (ASI 2017). This area has also likely been disturbed by the construction of infrastructure nearby (Map 10C). Following excavation, all test pits were backfilled to original grade.

2.5 Study Area 5

The Study Area located south of Mona Road and approximately 185 m northeast of the Rosemere SPS is 0.02 ha and was assessed by means of archaeological test pit survey (Map 10D). The test pit survey involved the hand excavation of test pits every 5 m along survey transects spaced 5 m from each other creating a 5 m grid of test pits (Images 22 to 23, pp 39-40). Each test pit was at least 30 cm in diameter and hand excavated by shovel and trowel. Where possible, test pits were excavated at least 5 cm into the subsoil which ranged in depth from 24-35 cm. Following excavation, all test pits were backfilled to original grade. A portion of the Study Area is sloped down to the creek (Image 24, p. 40) and could not be tested.

3.0 RECORDS OF FINDS

The Stage 2 Archaeological Assessment was conducted employing the methods described in Section 2.0. A *Garmin etrex 10* GPS device was employed, and the World Geodetic System (WGS) 84 Canadian Spatial Reference System (CSRS) was utilized to record all GPS readings to an accuracy of less than 3 m. A total of 32 artifacts, constituting two locations (Location 1 and Tall Oaks) were identified during the Stage 2 Archaeological Assessment of the Study Area.

All recovered artifacts have been washed, catalogued, and analysed, and are stored in one banker's boxes at WSP's office in Mississauga, Ontario. Table 4 provides an inventory of the documentary record generated in the field. A complete catalogue of the artifacts recovered during the Stage 2 Archaeological Assessment is provided below in Appendix A and B and detailed site location information is provided within the Supplementary Documentation.

Table 4: Inventory of Documentary Record

Document Type	Current Location of Document	Additional Comments	Quantity
Field Notes	WSP office in Mississauga	In hard copy and electronic project folders	9 pages

Maps Provided by Client	WSP office in Mississauga	Stored digitally in electronic project folder	1 map
Digital Photographs	WSP office in Mississauga	All photos are stored digitally in electronic project folder.	59 photos

3.1 Location 1

The Stage 2 Archaeological Assessment resulted in the recovery of two pre-contact Indigenous lithic artifacts at Location 1, which is located to the east of the Elmwood SPS within Study Area 2, between the Waterfront trail and Lake Ontario. A single piece of chert debitage was recovered from a grid test pit. Cardinal test pits were excavated, and a second piece of chert debitage was recovered from the cardinal test pit to the east. Aa test unit was dug over the original positive test pit, but no further finds were recovered. The GPS readings of the locations of the positive test pits were recorded and are provided within the Supplementary Documentation. Both pieces of chert debitage were Onondaga chert, which is a high-quality raw material that outcrops along the north shore of Lake Erie near the mouth of the Grand River. This material can also be recovered from secondary, glacial deposits across much of southwestern Ontario, east of Chatham (Eley and von Bitter 1989; Fox 2009).

The catalogue of artifacts from Location 1 is provided in Appendix A. A photograph of the artifacts recovered is provided as Image 25 (p. 41). A map detailing the location is provided within the Supplementary Documentation.

3.2 Tall Oaks (AjGv-95)

Tall Oaks (AjGv-95) is northeast of the Elmwood SPS within Study Area 2, approximately 30 m northwest from Location 1. Tall Oaks (AjGv-95) yielded 30 pre-contact Indigenous artifacts from a single positive test pit. All artifacts were collected and the GPS reading of the positive test pit was recorded and is provided in the Supplementary Documentation.

The catalogue of artifacts from Tall Oaks (AjGv-95) is provided in Appendix B. A photograph of a representative sample of artifacts is provided as Image 26 (p. 41). A map detailing the location of Tall Oaks (AjGv-95) is provided within the Supplementary Documentation.

3.2.1 Pre-Contact Indigenous Artifacts

The Stage 2 Archaeological Assessment resulted in the recovery of 30 pre-contact Indigenous lithic artifacts from a single positive test pit. All lithic material in the assemblage is Onondaga chert, which is a high-quality raw material that outcrops along the north shore of Lake Erie near the mouth of the Grand River. This material can also be recovered from secondary, glacial deposits across much of southwestern Ontario, east of Chatham (Eley and von Bitter 1989; Fox 2009).

Chert type identifications were accomplished visually using reference materials located in WSP's Mississauga office and published source material referenced in this regard includes: DeRegnaucourt and Georgiady 1998; Eley and von Bitter 1989; and Fox 2009). Also, the complete flake assemblage was subject to morphological analysis following the classification scheme described by Lennox et al. (1986) and expanded upon by Fisher (1997), with the exception that no attempt was made to distinguish "primary" from "primary bipolar" flakes.

3.2.1.1 Chipped Lithic Tools

The Stage 2 Archaeological Assessment produced 30 pieces of chert debitage from Tall Oaks (AjGv-95). All 30 flakes were of Onondaga chert, of which 7 pieces were heat-altered. The majority of the debitage assemblage was categorized as tertiary reduction flakes (59.4%, n=19), followed by broken flakes at 34.4% (n=11), and secondary flakes at 6.25% (n=2). Chert debitage is a waste product from the production of lithic tools and is the most commonly recovered artifact on pre-contact Indigenous archaeological sites in Ontario. A sample of debitage from Tall Oaks (AjGv-95) can be seen in Image 26 (p. 41) of Section 8.0.

4.0 ANALYSIS AND CONCLUSIONS

The Stage 2 Archaeological Assessment of the Study Area resulted in 3 positive test pits spread over two locations, Location 1, and Tall Oaks (AjGv-95). All recovered artifacts are pre-contact Indigenous in affiliation. Location 1 resulted in the recovery of 2 pieces of Onondaga chert debitage from two positive test pits. Tall Oaks (AjGv-95) resulted in the recovery of 30 pieces of Onondaga chert debitage from a single positive test pit.

4.1 Location 1

Based on the results of the Stage 2 Archaeological Assessment, Location 1 is concluded to be a findspot located within the eastern portion of Study Area 2, between the waterfront trail and Lake Ontario. The artifacts recovered were two pieces of Onondaga chert debitage. As the recovered assemblage consists of two non-diagnostic artifacts recovered within a less than 10 m by 10 m test pit area, Location 1 does not meet MCM criteria for having sufficient cultural heritage value or interest to require Stage 3 Archaeological Assessment.

4.2 Tall Oaks (AjGv-95)

Tall Oaks (AjGv-95) is a pre-contact Indigenous site located in the northern portion of Study Area 2, on the northwestern side of the waterfront trail, approximately 30 m from Location 1, and approximately 60 m from the shoreline of Lake Ontario. A total of 30 pre-contact Indigenous artifacts were recovered at Tall Oaks (AjGv-95) from one positive test pit. The pre-contact material consisted entirely of Onondaga chert debitage and did not include any diagnostic artifacts. Chipped lithic debitage is the waste product from the production of lithic tools and is the most commonly recovered artifact on pre-contact Indigenous archaeological sites in southern Ontario.

Tall Oaks (AjGv-95) likely represents the remains of a small temporary campsite; the lack of diagnostic artifacts prevents the location being assigned a temporal period.

Given the nature and frequency of pre-contact Indigenous artifacts recovered from Tall Oaks (AjGv-95), the site meets the criteria identified in Section 2.2, Standard 1a.ii.2 of the *Standards and Guidelines for Consultant Archaeologists* (MCM 2011) for having a level of cultural heritage value or interest that requires Stage 3 Archaeological Assessment.

The location of Tall Oaks (AjGv-95) is illustrated on mapping provided in the Supplementary Document.

5.0 RECOMMENDATIONS

The Stage 2 Archaeological Assessment resulted in the identification of two archaeological sites within the Study Area. Location 1 consists of two pieces of Onondaga chert debitage from two positive test pits. Cardinal test pits and a test unit were excavated, but there were no further finds. The site is located between the waterfront trail and Lake Ontario and measures approximately 5 m x 5 m. Based on these results, Location 1 does not meet MCM criteria for having sufficient cultural heritage value or interest to require Stage 3 Archaeological Assessment.

Tall Oaks (AjGv-95) yielded 30 pieces of Onondaga chert debitage from a single test pit. The site is located northeast of the Elmwood SPS and measures approximately 5 m x 5 m. Given the presence of at least 10 non-diagnostic pre-contact Indigenous artifacts within a 10 m by 10 m test pit survey area, as per *Section 2.2., Standards 1.a.ii (2)* of the MCM (2011), this site is considered to have further cultural heritage value and interest and a Stage 3 Archaeological Assessment is recommended.

Based on the results of the Stage 2 Archaeological Assessment documented herein, the following recommendations are presented:

1) **Location 1:** In accordance with *Section 2.2, Standard 1* (MCM 2011), Location 1 retains no further cultural heritage value or interest. No further archaeological assessment is recommended.

2) **Tall Oaks (AjGv-95):** Based on the above results, a Stage 3 Archaeological Assessment is recommended for Tall Oaks (AjGv-95) in accordance with the MCM (2011) prior to any intrusive activity that may result in the destruction or disturbance to the site. The Stage 3 Archaeological Assessment should define the site extent, gather a representative sample of artifacts, and aid in the determination of a Stage 4 mitigation strategy, if required.

   The Stage 3 Archaeological Assessment should commence with the establishment of a site datum prior to beginning test unit excavation following the strategy for small pre-contact sites where it is not yet evident that the level of cultural heritage value or interest will result in a recommendation to proceed to Stage 4 mitigation (MCM 2011; *Section 3.2.3, Table 3.1, Standard 1 and 2)*.

3) Study Areas 1, 3, 4, and 5 retain no further cultural heritage value or interest. No further archaeological assessment is recommended for these areas.

Despite efforts and due diligence, no archaeological assessment can necessarily account for potential archaeological resources. Should deeply buried archaeological resources be identified during ground disturbance activity associated with future development of the Study Area, ground disturbance activities shall be immediately halted, and the Archaeology Division of the Culture Programs Unit of the Ministry of Citizenship and Multiculturalism (MCM) notified.

The MCM is requested to review, and provide a letter indicating their satisfaction with the results and recommendations presented herein, with regard to the 2011 *Standards and Guidelines for Consultant Archaeologists* and the terms and conditions for archaeological licences, and to enter this report into the Ontario Public Register of Archaeological Reports.

6.0 ADVICE ON COMPLIANCE WITH LEGISLATION

This report is submitted to the Minister of Citizenship and Multiculturalism, as a condition of licensing in accordance with Part VI of the *Ontario Heritage Act*, R.S.O. 1990, c 0.18. The report is reviewed to ensure that it complies with the standards and guidelines that are issued by the Minister, and that the archaeological fieldwork and report recommendations ensure the conservation, protection, and preservation of the cultural heritage of Ontario. When all matters relating to archaeological sites within the project area of a development proposal have been addressed to the satisfaction of the Ministry of Heritage, Sport, Tourism, Cultural Industries, a letter will be issued by the ministry stating that there are no further concerns with regard to alterations to archaeological sites by the proposed development.

It is an offence under Sections 48 and 69 of the *Ontario Heritage Act* for any party other than a licensed archaeologist to make any alteration to a known archaeological site or to remove any artifact or other physical evidence of past human use or activity from the site, until such time as a licensed archaeologist has completed archaeological fieldwork on the site, submitted a report to the Minister stating that the site has no further cultural heritage value or interest , and the report has been filed in the Ontario Public Register of Archaeology Reports referred to in Section 65.1 of the *Ontario Heritage Act*.

Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48 (1) of the *Ontario Heritage Act*. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act*.

The *Funeral, Burial and Cremation Services Act*, 2002, S.O. 2002, c.33, requires that any person discovering or having knowledge of a burial site shall immediately notify the police or coroner. It is recommended that the Registrar of Cemeteries at the Ontario Ministry of Consumer Services is also immediately notified.

Executive Summary

Background

In March 2020, GM BluePlan Engineering Limited (GM BluePlan) retained Golder Associates Ltd. (Golder) to conduct a Cultural Heritage Screening Report (CHSR) as part of a Schedule C Municipal Class Environmental Assessment (MCEA) for the Port Credit East Wastewater Servicing Optimization Strategy (the Project) in the City of Mississauga, Region of Peel, Ontario. The purpose of the Project is to investigate alternative wastewater strategies for the Rosemere, Hiawatha, and Elmwood sewage pumping station (SPS) servicing areas and develop an integrated servicing strategy that supports existing servicing needs and projected growth.

The study area (as defined by GMBP) is generally limited by the Credit River in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Enola Avenue in the north, and Lake Ontario in the east.

The objectives of the CHSR was to identify from desktop sources all known and potential cultural heritage resources within or crossed by the study area and determine if the Project will require subsequent cultural heritage studies such as a Cultural Heritage Existing Conditions and Preliminary Impact Assessment (CHECPIA) or site-specific Cultural Heritage Evaluation Reports (CHERs) or Heritage Impact Assessments (HIAs).

Results

Background research and desktop analysis of the study area based on the Ministry of Heritage, Sport, Tourism and Culture Industries (MHSTCI) Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes (2016) checklist identified:

- 8 protected heritage properties designated under Part IV of the *Ontario Heritage Act*
- 1 protected heritage property designated under Part V of the *Ontario Heritage Act*
- 67 properties listed (not designated) on the City of Mississauga's *Heritage Register*
- 4 cultural heritage landscapes listed (not designated) on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*
- 648 properties with buildings or structures 40 or more years old of potential cultural heritage value or interest (CHVI)
- 1 potential cultural heritage landscape

Recommendations

Due to the high number of known and potential built heritage resources and cultural heritage landscapes in the study area, Golder recommends to:

- site and route all infrastructure to avoid the cultural heritage resources identified in this CHSR:
  - listed (not designated) heritage properties or cultural heritage landscapes (CHL), properties of potential CHVI, and the potential CHL can be avoided by limiting all construction to within public rights-of-way; and,

  - however, construction adjacent to any of the protected heritage properties designated under Part IV or Part V of the *OHA* will require an impact assessment compliant with the *City of Mississauga Heritage Impact Assessment Terms of Reference* (2014) prior to detailed design to recommend the appropriate mitigations.

- if a listed (not designated) heritage property or cultural heritage landscape (CHL), properties of potential CHVI property, or the potential CHL cannot be feasibly avoided, consult the City of Mississauga to determine if a Cultural Heritage Evaluation Report (CHER) is required:
  - if required, the CHER should determine if the property meets the criteria for CHVI prescribed in *Ontario Regulation 9/06.* If the CHER finds that the resource has CHVI, conduct an HIA prior to detailed design to recommend the appropriate mitigations.
- if a protected heritage property designated under Part IV or Part V of the *OHA* cannot be feasibly avoided (including work on adjacent parcels or rights-of-way), conduct a Heritage Impact Assessment (HIA) that is compliant with the *City of Mississauga Heritage Impact Assessment Terms of Reference* (2014) prior to detailed design to recommend the appropriate mitigations.

If multiple known and potential built heritage resources and cultural heritage landscapes identified in this CHSR cannot be feasibly avoided, Golder recommends to:

- conduct a Cultural Heritage Existing Conditions and Preliminary Impact Assessment (CHECPIA) prior to detailed design. The CHECPIA should:
  - evaluate at a preliminary level the listed (not designated) heritage properties, properties of potential CHVI, and the potential CHL to determine if they meet the criteria for CHVI prescribed in *Ontario Regulation 9/06;*
  - identify impacts to the protected heritage properties designated under Part IV or Part V of the *OHA*, listed (not designated) heritage properties or cultural heritage landscapes, and the properties and landscapes evaluated to have CHVI; and,
  - recommend the appropriate mitigations to avoid or reduce adverse impacts to all built heritage resources and cultural heritage landscapes.

Study Limitations

Golder has prepared this report in a manner consistent with the guidelines developed by the Ministry of Heritage, Sport, Tourism and Culture Industries (MHSTCI) and City of Mississauga, subject to the time limits and physical constraints applicable to this report.

This report has been prepared for the specific site, design objective, developments, and purpose described to Golder by GM BluePlan Engineering Limited (the Client). The factual data, interpretations, and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location.

The information, recommendations, and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without Golder's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the Client, Golder may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to Golder. The report, all plans, data, drawings, and other documents as well as electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permissions of Golder. The Client acknowledges the electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client cannot rely upon the electronic media versions of Golder's report or other work products.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project.

1.0 INTRODUCTION

In March 2020, GM BluePlan Engineering Limited (GM BluePlan) retained Golder Associates Ltd. (Golder) to conduct a Cultural Heritage Screening Report (CHSR) as part of a Schedule C Municipal Class Environmental Assessment (MCEA) for the Port Credit East Wastewater Servicing Optimization Strategy (the Project) in the City of Mississauga, Region of Peel, Ontario. The purpose of the Project is to investigate alternative wastewater strategies for the Rosemere, Hiawatha, and Elmwood sewage pumping station (SPS) servicing areas and develop an integrated servicing strategy that supports existing servicing needs and projected growth.

The study area (as defined by GMBP) is generally limited by the Credit River in the south, Veronica Drive and just east of Forest Avenue in the west, just south of Enola Avenue in the north, and Lake Ontario in the east. (Figure 1).

The objectives of this CHSR are to identify from desktop sources all known and potential cultural heritage resources within or crossed by the study area and determine if the Project will require subsequent cultural heritage studies such as a Cultural Heritage Existing Conditions and Preliminary Impact Assessment (CHECPIA) or site-specific Cultural Heritage Evaluation Reports (CHERs) or Heritage Impact Assessments (HIAs). This CHSR follows the *Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes* checklist published by the Ministry of Heritage, Sport, Tourism and Culture Industries (MHSTCI) in 2016.

2.0 KEY LEGISLATION & POLICIES

In Ontario, several provincial and municipal policies and legislation guide identifying, protecting, and managing cultural heritage resources.

2.1 Environmental Assessment Act

The *Environmental Assessment Act (EAA)* was drafted to ensure that Ontario's environment is protected, conserved, and wisely managed. Under the *EAA,* "environment" includes not only natural elements such as air, land, water and plant and animal life, but also the "social, economic and cultural conditions that influence the life of humans or a community", and "any building, structure, machine or other device or thing made by humans". To determine the potential environmental effects of a new development, the Environmental Assessment (EA) process was created to standardize decision-making.

2.2 Planning Act and Provincial Policy Statement 2020

The Ontario *Planning Act* (1990) and associated *Provincial Policy Statement* 2020 (PPS 2020) mandate heritage conservation in land use planning. Under the *Planning Act*, conservation of "features of significant architectural, cultural, historical, archaeological or scientific interest" are a "matter of provincial interest" and integrates this at the provincial and municipal levels through the PPS 2020. Issued under Section 3 of the *Planning Act*, PPS 2020 recognizes that cultural heritage and archaeological resources "provide important environmental, economic, and social benefits", and that "encouraging a sense of place, by promoting well-designed built form and cultural planning, and by conserving features that help define character, including *built heritage resources* and *cultural heritage landscapes*" supports long-term economic prosperity (PPS 2020:6,22).

The importance of identifying and evaluating built heritage and cultural heritage landscapes is recognized in two policies of PPS 2020:

- Section 2.6.1 – *Significant built heritage resources* and *significant heritage landscapes* shall be conserved
- Section 2.6.3 – Planning authorities shall not permit *development* and *site alteration* on *adjacent lands* to *protected heritage property* except where the proposed *development* and *site alteration* has been evaluated and it has been demonstrated that the *heritage attributes* of the *protected heritage property* will be conserved

Each of the italicised terms is defined in Section 6.0 of PPS 2020:

- ***Adjacent lands*:** for the purposes of policy 2.6.3, those lands contiguous to a *protected heritage property* or as otherwise defined in the municipal official plan.
- ***Built heritage resource:*** means a building, structure, monument, installation or any manufactured or constructed part or remnant that contributes to a property's cultural heritage value or interest as identified by a community, including an Indigenous community. *Built heritage resources* are located on property that may be designated under Parts IV or V of the *Ontario Heritage Act*, or that may be included on local, provincial, federal and/or international registers.

- ***Conserved*:** means the identification, protection, management and use of built heritage resources, cultural heritage landscapes, and archaeological resources in a manner that ensures their cultural heritage value or interest is retained. This may be achieved by the implementation of recommendations set out in a conservation plan, archaeological assessment, and/or heritage impact assessment that has been approved, accepted, or adopted by the relevant planning authority and/or decision-maker. Mitigative measures and/or alternative development approaches can be included in these plans and assessments.
- ***Cultural heritage landscape:*** means a defined geographical area that may have been modified by human activity and is identified as having cultural heritage value or interest by a community, including an Indigenous community. The area may include features such as buildings, structures, spaces, views, archaeological sites, or natural elements that are valued together for their interrelationship, meaning, or association. Cultural heritage landscapes may be properties that have been determined to have cultural heritage value or interest under the *Ontario Heritage Act*; or have been included on federal and/or international registers, and/or protected through official plan, zoning by-law, or other land use planning mechanisms.
- ***Development*:** means the creation of a new lot, a change in land use, or the construction of buildings and structures requiring approval under the Planning Act.
- ***Heritage attributes:*** the principal features or elements that contribute to a protected heritage property's cultural heritage value or interest, and may include the property's built, constructed, or manufactured elements, as well as natural landforms, vegetation, water features, and its visual setting (e.g., significant views or vistas to or from a protected heritage property).
- ***Protected heritage property:*** property designated under Parts IV, V, or VI of the *Ontario Heritage Act*; property subject to a heritage conservation easement under Parts II or IV of the *Ontario Heritage Act*; property identified by the Province and prescribed public bodies as provincial heritage property under the Standards and Guidelines for Conservation of Provincial Heritage Properties; property protected under federal legislation, and UNESCO World Heritage Sites.
- ***Significant*:** means, in regard to cultural heritage and archaeology, resources that have been determined to have cultural heritage value or interest. Processes and criteria for determining cultural heritage value or interest are established by the Province under the authority of the *Ontario Heritage Act*.

Importantly, the definition for *significant* includes a caveat that "criteria for determining significance…are recommended by the Province, but municipal approaches that achieve or exceed the same objective may also be used", and that "while some significant resources may already be identified and inventoried by official sources, the significance of others can only be determined after evaluation."

For municipalities, PPS 2020 is implemented through an Official Plan, which may outline further heritage policies.

2.3 Ontario Heritage Act and *Ontario Regulation 9/06*

The *Ontario Heritage Act (OHA)* enables the Province and municipalities to conserve significant individual properties and areas. For provincially owned, administered, or occupied heritage properties, compliance with the MHSTCI S&Gs is mandatory under Part III of the *OHA* and holds the same authority for ministries and prescribed public bodies as a Management Board or Cabinet directive. For municipalities, Part IV, and Part V of the *OHA* enables council to "designate" individual properties (Part IV), or properties within a heritage conservation district

(HCD) (Part V), as being of "cultural heritage value or interest" (CHVI). Evaluation for CHVI under the *OHA* (or *significance* under PPS 2020) is guided by *Ontario Regulation 9/06* (*O. Reg. 9/06*), which prescribes the *criteria for determining cultural heritage value or interest*. *O. Reg. 9/06* has three categories of absolute or non-ranked criteria, each with three sub-criteria:

1) The property has ***design value or physical value*** because it:

   i) Is a rare, unique, representative or early example of a style, type, expression, material or construction method;

   ii) Displays a high degree of craftsmanship or artistic merit; or,

   iii) Demonstrates a high degree of technical or scientific achievement.

2) The property has historic value or associative value because it:

   i) Has direct associations with a theme, event, belief, person, activity, organization, or institution that is significant to a community;

   iv) Yields, or has the potential to yield information that contributes to an understanding of a community or culture; or,

   v) Demonstrates or reflects the work or ideas of an architect, artist, builder, designer, or theorist who is significant to a community.

3) The property has ***contextual value*** because it:

   i) Is important in defining, maintaining or supporting the character of an area;

   vi) Is physically, functionally, visually or historically linked to its surroundings; or,

   vii) Is a landmark.

A property needs to meet only one criterion of *O. Reg. 9/06* to be considered for designation under Part IV of the *OHA*. If found to meet one or more criterion, the property's CHVI is then described with a Statement of Cultural Heritage Value or Interest (SCHVI) that includes a brief property description, a succinct statement of the property's cultural heritage significance, and a list of its heritage attributes. In the *OHA* heritage attributes are defined slightly differently to the PPS 2020 and directly linked to real property[1]; therefore, in most cases a property's CHVI applies to the entire land parcel, not just individual buildings or structures. Once a municipal council decides to designate a property, it is recognized through by-law and added to a "Register" maintained by the municipal clerk. A municipality may also "list" a property on the Register to indicate it as having potential cultural heritage value or interest.

[1] The *OHA* definition "heritage attributes means, in relation to real property, and to the buildings and structures on the real property, the attributes of the property, buildings and structures that contribute to their cultural heritage value or interest."

3.0 SCOPE & METHOD

The scope for a CHSR is outlined in the MHSTCI *Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes: A Checklist for the Non-Specialist* (2016; the MHSTCI *Checklist*). The MHSTCI *Checklist* provides a tool to identify from desktop sources all known or recognized cultural heritage resources in a study area, as well as commemorative plaques, cemeteries, Canadian Heritage River watersheds, properties with buildings 40 or more years old, or potential cultural heritage landscapes. Since cultural heritage is linked to real property under the *OHA*, the desktop analysis included all parcels within or crossed by the study area boundaries.

To complete the MHSTCI *Checklist*, Golder undertook the following tasks:

- **Task 1:** Review of federal, provincial, and municipal heritage registers, inventories, databases, historical maps, and aerial imagery to identify known or potential cultural heritage resources within the study area. These sources include:
  - *Canadian Register of Historic Places* (https://www.historicplaces.ca/en/pages/about-apropos.aspx)
  - *Parks Canada Directory of Federal Heritage Designations* (http://www.pc.gc.ca/apps/dfhd/search-recherche_eng.aspx) and *Directory of Heritage Railway Stations* (https://www.pc.gc.ca/en/culture/clmhc-hsmbc/pat-her/gar-sta/on)
  - *Ontario Heritage Trust Ontario Places of Worship Inventory* (https://www.heritagetrust.on.ca/en/places-of-worship/places-of-worship-database/search) and *Plaque Database* (http://www.heritagetrust.on.ca/en/online-plaque-guide)
  - *Canadian Heritage Rivers System* (https://chrs.ca/en)
  - *Ontario Historical County Maps Project* Web Map Application (http://utoronto.maps.arcgis.com/apps/webappviewer/index.html?id=8cc6be34f6b54992b27da17467492d2f)
  - *Historic Topographic Map Digitization Project* (https://ocul.on.ca/topomaps/collection/)
  - City of Mississauga
    - *Heritage Register* (https://www.mississauga.ca/wp-content/uploads/2020/06/10135918/2018-07-01_Mississauga_Heritage_Register_Web.pdf)
    - *Cultural Heritage Landscape Inventory* (http://www5.mississauga.ca/pdfs/Cultural_Landscape_Inventory_Jan05.pdf)
    - *Cultural Heritage Landscape Project* (https://yoursay.mississauga.ca/cultural-heritage-landscape-project/maps/phase-2-map)
    - *Old Port Credit Heritage Conservation District Plan 2018* (https://www7.mississauga.ca/documents/culture/heritage/Final_Version_HCD_Plan_January_2020.pdf)
    - *Interactive Online Mapping Service* pre-1980 aerial imagery (http://www6.mississauga.ca/missmaps/maps.aspx)

  - *Open Data: City Heritage Properties* (https://data.mississauga.ca/datasets/city-heritage-properties?geometry=-79.948%2C43.503%2C-79.294%2C43.590)
  - *Open Data: City Cemeteries* (https://data.mississauga.ca/datasets/city-cemeteries?geometry=-80.344%2C43.528%2C-79.037%2C43.702)
- Google Street View©

- **Task 2:** Contact heritage planning staff at the City of Mississauga
- **Task 3:** Map all identified known and potential built heritage resources and cultural heritage landscapes and recommended further studies based on the MHSTCI *Checklist*
  - To reduce complexity in mapping and description, the study area was divided into twelve quadrants, numbered from Quadrant 1 in the northwest to Quadrant 12 in the southeast.

4.0 STUDY RESULTS

4.1 Overview of Study Results

Tasks 1 to 3 identified:

- 8 protected heritage properties designated under Part IV of the *Ontario Heritage Act*
- 1 protected heritage property designated under Part V of the *Ontario Heritage Act*
- 67 properties listed (not designated) on the City of Mississauga's *Heritage Register*
- 4 cultural heritage landscapes listed (not designated) on the City of Mississauga's *Inventory of Cultural Heritage Landscapes*
- 648 properties with buildings or structures 40 or more years old of potential cultural heritage value or interest (CHVI)
- 1 potential cultural heritage landscape

These are identified by quadrant in the following sub-sections. the completed MHSTCI *Checklist* and supplementary documentation is provided in APPENDIX A and APPENDIX B.

4.2 Results of Engagement

Table 1 lists the results of engagement with City of Mississauga heritage planning staff.

Table 1: Municipal engagement

Contact	Information Request	Response Received
John Dunlop, Supervisor, Heritage Planning, City of Mississauga	Query sent via email on April 16, 2020 to confirm that the City's registry of designated properties, listed properties, and cultural heritage landscapes is up to date. Golder also inquired if there were any cemeteries or commemorative plaques within the Elmwood and Hiawatha areas, and if the City had any cultural heritage concerns.	Response received via email on April 20, 2020 providing a map of all heritage properties located within the Elmwood and Hiawatha areas. A link to the municipal map portal was also provided for further information on cemeteries, and it was noted that there are Ontario Heritage Trust plaques near the Elmwood and Hiawatha areas and several underwater archaeological resources in Lake Ontario. The City requested that Golder include mention of the Adamson Estates.
	Voicemail on November 25, 2020 to inquire if there are any cultural heritage constraints in the north extension of the study area.	Telephone conversation on November 26, 2020 noting that the north extension includes the Mineola Neighbourhood Cultural Heritage Landscape and the presence of a mature "tree of note" at 40 Oriole Avenue. Also noted was the high potential for archaeological sites along the Credit River.

4.3 Identified Known and Potential Built Heritage Resources & Cultural Heritage Landscapes

4.3.1 Quadrant 1

Table 2 lists the known and potential properties of cultural heritage value or interest (CHVI) in Quadrant 1 of the study area in alphabetical order by street name. These known and potential properties of CHVI are mapped on Figure 2.

Table 2: Known and potential properties of CHVI identified through desktop analysis in Quadrant 1

Civic Address or Location	Description	Cultural Heritage Status

5.0 RECOMMENDATIONS

Due to the high number of known and potential built heritage resources and cultural heritage landscapes in the study area, Golder recommends to:

- site and route all infrastructure to avoid the cultural heritage resources identified in this CHSR.
  - listed (not designated) heritage properties or cultural heritage landscapes (CHL), properties of potential CHVI, and the potential CHL can be avoided by limiting all construction to within public rights-of-way;
  - however, construction adjacent to any of the protected heritage properties designated under Part IV or Part V of the *OHA* will require an impact assessment compliant with the *City of Mississauga Heritage Impact Assessment Terms of Reference* (2014) prior to detailed design to recommend the appropriate mitigations.
- if a listed (not designated) heritage property or cultural heritage landscape (CHL), properties of potential CHVI property, or the potential CHL cannot be feasibly avoided, consult the City of Mississauga to determine if a Cultural Heritage Evaluation Report (CHER) is required.
  - if required, the CHER should determine if the property meets the criteria for CHVI prescribed in *Ontario Regulation 9/06.* If the CHER finds that the resource has CHVI, conduct an HIA prior to detailed design to recommend the appropriate mitigations.
- if a protected heritage property designated under Part IV or Part V of the *OHA* cannot be feasibly avoided (including work on adjacent parcels or rights-of-way), conduct a Heritage Impact Assessment (HIA) that is compliant with the *City of Mississauga Heritage Impact Assessment Terms of Reference* (2014) prior to detailed design to recommend the appropriate mitigations.

If multiple known and potential built heritage resources and cultural heritage landscapes identified in this CHSR cannot be feasibly avoided, Golder recommends to:

- conduct a Cultural Heritage Existing Conditions and Preliminary Impact Assessment (CHECPIA) prior to detailed design. The CHECPIA should:
  - evaluate at a preliminary level the listed (not designated) heritage properties, properties of potential CHVI, and the potential CHL to determine if they meet the criteria for CHVI prescribed in *Ontario Regulation 9/06*
  - identify impacts to the protected heritage properties designated under Part IV or Part V of the *OHA*, listed (not designated) heritage properties or cultural heritage landscapes, and the properties and landscapes evaluated to have CHVI and,
  - recommend the appropriate mitigations to avoid or reduce adverse impacts to all built heritage resources and cultural heritage landscapes.

APPENDIX A

MHSTCI Checklist

Clear Form Print Form

Ontario

Ministry of Tourism, Culture and Sport

Programs & Services Branch
401 Bay Street, Suite 1700
Toronto ON M7A 0A7

Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes

A Checklist for the Non-Specialist

The **purpose of the checklist** is to determine:

- if a property(ies) or project area:
  - is a recognized heritage property
  - may be of cultural heritage value
- it includes all areas that may be impacted by project activities, including – but not limited to:
  - the main project area
  - temporary storage
  - staging and working areas
  - temporary roads and detours

Processes covered under this checklist, such as:

- *Planning Act*
- *Environmental Assessment Act*
- *Aggregates Resources Act*
- *Ontario Heritage Act* – Standards and Guidelines for Conservation of Provincial Heritage Properties

Cultural Heritage Evaluation Report (CHER)

If you are not sure how to answer one or more of the questions on the checklist, you may want to hire a qualified person(s) (see page 5 for definitions) to undertake a cultural heritage evaluation report (CHER).

The CHER will help you:

- identify, evaluate and protect cultural heritage resources on your property or project area
- reduce potential delays and risks to a project

Other checklists

Please use a separate checklist for your project, if:

- you are seeking a Renewable Energy Approval under Ontario Regulation 359/09 – separate checklist
- your Parent Class EA document has an approved screening criteria (as referenced in Question 1)

Please refer to the Instructions pages for more detailed information and when completing this form.

Screening Questions

	Yes	No
1. Is there a pre-approved screening checklist, methodology or process in place?	☐	☑

If Yes, please follow the pre-approved screening checklist, methodology or process.

If No, continue to Question 2.

Part A: Screening for known (or recognized) Cultural Heritage Value

	Yes	No
2. Has the property (or project area) been evaluated before and found **not** to be of cultural heritage value?	☐	☑

If Yes, do **not** complete the rest of the checklist.

The proponent, property owner and/or approval authority will:

- summarize the previous evaluation and
- add this checklist to the project file, with the appropriate documents that demonstrate a cultural heritage evaluation was undertaken

The summary and appropriate documentation may be:

- submitted as part of a report requirement
- maintained by the property owner, proponent or approval authority

If No, continue to Question 3.

	Yes	No
3. Is the property (or project area):		
a. identified, designated or otherwise protected under the *Ontario Heritage Act* as being of cultural heritage value?	☑	☐
b. a National Historic Site (or part of)?	☐	☑
c. designated under the *Heritage Railway Stations Protection Act*?	☐	☑
d. designated under the *Heritage Lighthouse Protection Act*?	☐	☑
e. identified as a Federal Heritage Building by the Federal Heritage Buildings Review Office (FHBRO)?	☐	☑
f. located within a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site?	☐	☑

If Yes to any of the above questions, you need to hire a qualified person(s) to undertake:

- a Cultural Heritage Evaluation Report, if a Statement of Cultural Heritage Value has not previously been prepared or the statement needs to be updated

If a Statement of Cultural Heritage Value has been prepared previously and if alterations or development are proposed, you need to hire a qualified person(s) to undertake:

- a Heritage Impact Assessment (HIA) – the report will assess and avoid, eliminate or mitigate impacts

If No, continue to Question 4.

Part B: Screening for Potential Cultural Heritage Value

	Yes	No
4. Does the property (or project area) contain a parcel of land that:		
a. is the subject of a municipal, provincial or federal commemorative or interpretive plaque?	☐	☑
b. has or is adjacent to a known burial site and/or cemetery?	☑	☐
c. is in a Canadian Heritage River watershed?	☐	☑
d. contains buildings or structures that are 40 or more years old?	☑	☐

Part C: Other Considerations

	Yes	No
5. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area):		
a. is considered a landmark in the local community or contains any structures or sites that are important in defining the character of the area?	☑	☐
b. has a special association with a community, person or historical event?	☑	☐
c. contains or is part of a cultural heritage landscape?	☑	☐

If Yes to one or more of the above questions (Part B and C), there is potential for cultural heritage resources on the property or within the project area.

You need to hire a qualified person(s) to undertake:

- a Cultural Heritage Evaluation Report (CHER)

If the property is determined to be of cultural heritage value and alterations or development is proposed, you need to hire a qualified person(s) to undertake:

- a Heritage Impact Assessment (HIA) – the report will assess and avoid, eliminate or mitigate impacts

If No to all of the above questions, there is low potential for built heritage or cultural heritage landscape on the property.

The proponent, property owner and/or approval authority will:

- summarize the conclusion
- add this checklist with the appropriate documentation to the project file

The summary and appropriate documentation may be:

- submitted as part of a report requirement e.g. under the *Environmental Assessment Act, Planning Act* processes
- maintained by the property owner, proponent or approval authority

Instructions

Please have the following available, when requesting information related to the screening questions below:

- a clear map showing the location and boundary of the property or project area
  - large scale and small scale showing nearby township names for context purposes
- the municipal addresses of all properties within the project area
- the lot(s), concession(s), and parcel number(s) of all properties within a project area

For more information, see the Ministry of Tourism, Culture and Sport's Ontario Heritage Toolkit or Standards and Guidelines for Conservation of Provincial Heritage Properties.

In this context, the following definitions apply:

- **qualified person(s)** means individuals – professional engineers, architects, archaeologists, etc. – having relevant, recent experience in the conservation of cultural heritage resources.
- **proponent** means a person, agency, group or organization that carries out or proposes to carry out an undertaking or is the owner or person having charge, management or control of an undertaking.

1. Is there a pre-approved screening checklist, methodology or process in place?

An existing checklist, methodology or process may already be in place for identifying potential cultural heritage resources, including:

- one endorsed by a municipality
- an environmental assessment process e.g. screening checklist for municipal bridges
- one that is approved by the Ministry of Tourism, Culture and Sport (MTCS) under the Ontario government's Standards & Guidelines for Conservation of Provincial Heritage Properties [s.B.2.]

Part A: Screening for known (or recognized) Cultural Heritage Value

2. Has the property (or project area) been evaluated before and found not to be of cultural heritage value?

Respond 'yes' to this question, if all of the following are true:

A property can be considered not to be of cultural heritage value if:

- a Cultural Heritage Evaluation Report (CHER) - or equivalent - has been prepared for the property with the advice of a qualified person and it has been determined not to be of cultural heritage value and/or
- the municipal heritage committee has evaluated the property for its cultural heritage value or interest and determined that the property is not of cultural heritage value or interest

A property may need to be re-evaluated, if:

- there is evidence that its heritage attributes may have changed
- new information is available
- the existing Statement of Cultural Heritage Value does not provide the information necessary to manage the property
- the evaluation took place after 2005 and did not use the criteria in Regulations 9/06 and 10/06

Note: Ontario government ministries and public bodies [prescribed under Regulation 157/10] may continue to use their existing evaluation processes, until the evaluation process required under section B.2 of the Standards & Guidelines for Conservation of Provincial Heritage Properties has been developed and approved by MTCS.

To determine if your property or project area has been evaluated, contact:

- the approval authority
- the proponent
- the Ministry of Tourism, Culture and Sport

3a. Is the property (or project area) identified, designated or otherwise protected under the *Ontario Heritage Act* as being of cultural heritage value e.g.:

i. designated under the *Ontario Heritage Act*

- individual designation (Part IV)
- part of a heritage conservation district (Part V)

Individual Designation – Part IV

A property that is designated:

- by a municipal by-law as being of cultural heritage value or interest [s.29 of the *Ontario Heritage Act*]
- by order of the Minister of Tourism, Culture and Sport as being of cultural heritage value or interest of provincial significance [s.34.5]. **Note**: To date, no properties have been designated by the Minister.

Heritage Conservation District – Part V

A property or project area that is located within an area designated by a municipal by-law as a heritage conservation district [s. 41 of the *Ontario Heritage Act*].

For more information on Parts IV and V, contact:

- municipal clerk
- Ontario Heritage Trust
- local land registry office (for a title search)

---

ii. subject of an agreement, covenant or easement entered into under Parts II or IV of the *Ontario Heritage Act*

An agreement, covenant or easement is usually between the owner of a property and a conservation body or level of government. It is usually registered on title.

The primary purpose of the agreement is to:

- preserve, conserve, and maintain a cultural heritage resource
- prevent its destruction, demolition or loss

For more information, contact:

- Ontario Heritage Trust - for an agreement, covenant or easement [clause 10 (1) (c) of the *Ontario Heritage Act*]
- municipal clerk – for a property that is the subject of an easement or a covenant [s.37 of the *Ontario Heritage Act*]
- local land registry office (for a title search)

---

iii. listed on a register of heritage properties maintained by the municipality

Municipal registers are the official lists - or record - of cultural heritage properties identified as being important to the community.

Registers include:

- all properties that are designated under the *Ontario Heritage Act* (Part IV or V)
- properties that have not been formally designated, but have been identified as having cultural heritage value or interest to the community

For more information, contact:

- municipal clerk
- municipal heritage planning staff
- municipal heritage committee

---

iv. subject to a notice of:

- intention to designate (under Part IV of the *Ontario Heritage Act*)
- a Heritage Conservation District study area bylaw (under Part V of the *Ontario Heritage Act*)

A property that is subject to a **notice of intention to designate** as a property of cultural heritage value or interest and the notice is in accordance with:

- section 29 of the *Ontario Heritage Act*
- section 34.6 of the *Ontario Heritage Act.* **Note**: To date, the only applicable property is Meldrum Bay Inn, Manitoulin Island. [s.34.6]

An area designated by a municipal by-law made under section 40.1 of the *Ontario Heritage Act* as a **heritage conservation district study area**.

For more information, contact:

- municipal clerk – for a property that is the subject of notice of intention [s. 29 and s. 40.1]
- Ontario Heritage Trust

---

v. included in the Ministry of Tourism, Culture and Sport's list of provincial heritage properties

Provincial heritage properties are properties the Government of Ontario owns or controls that have cultural heritage value or interest.

The Ministry of Tourism, Culture and Sport (MTCS) maintains a list of all provincial heritage properties based on information provided by ministries and prescribed public bodies. As they are identified, MTCS adds properties to the list of provincial heritage properties.

For more information, contact the MTCS Registrar at registrar@ontario.ca.

3b. Is the property (or project area) a National Historic Site (or part of)?

National Historic Sites are properties or districts of national historic significance that are designated by the Federal Minister of the Environment, under the *Canada National Parks Act*, based on the advice of the Historic Sites and Monuments Board of Canada.

For more information, see the National Historic Sites website.

3c. Is the property (or project area) designated under the *Heritage Railway Stations Protection Act*?

The *Heritage Railway Stations Protection Act* protects heritage railway stations that are owned by a railway company under federal jurisdiction. Designated railway stations that pass from federal ownership may continue to have cultural heritage value.

For more information, see the Directory of Designated Heritage Railway Stations.

3d. Is the property (or project area) designated under the *Heritage Lighthouse Protection Act*?

The *Heritage Lighthouse Protection Act* helps preserve historically significant Canadian lighthouses. The Act sets up a public nomination process and includes heritage building conservation standards for lighthouses which are officially designated.

For more information, see the Heritage Lighthouses of Canada website.

3e. Is the property (or project area) identified as a Federal Heritage Building by the Federal Heritage Buildings Review Office?

The role of the Federal Heritage Buildings Review Office (FHBRO) is to help the federal government protect the heritage buildings it owns. The policy applies to all federal government departments that administer real property, but not to federal Crown Corporations.

For more information, contact the Federal Heritage Buildings Review Office.

See a directory of all federal heritage designations.

3f. Is the property (or project area) located within a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site?

A UNESCO World Heritage Site is a place listed by UNESCO as having outstanding universal value to humanity under the Convention Concerning the Protection of the World Cultural and Natural Heritage. In order to retain the status of a World Heritage Site, each site must maintain its character defining features.

Currently, the Rideau Canal is the only World Heritage Site in Ontario.

For more information, see Parks Canada – World Heritage Site website.

Part B: Screening for potential Cultural Heritage Value

4a. Does the property (or project area) contain a parcel of land that has a municipal, provincial or federal commemorative or interpretive plaque?

Heritage resources are often recognized with formal plaques or markers.

Plaques are prepared by:

- municipalities
- provincial ministries or agencies
- federal ministries or agencies
- local non-government or non-profit organizations

For more information, contact:

- municipal heritage committees or local heritage organizations – for information on the location of plaques in their community
- Ontario Historical Society's Heritage directory – for a list of historical societies and heritage organizations
- Ontario Heritage Trust – for a list of plaques commemorating Ontario's history
- Historic Sites and Monuments Board of Canada – for a list of plaques commemorating Canada's history

4b. Does the property (or project area) contain a parcel of land that has or is adjacent to a known burial site and/or cemetery?

For more information on known cemeteries and/or burial sites, see:

- Cemeteries Regulations, Ontario Ministry of Consumer Services – for a database of registered cemeteries
- Ontario Genealogical Society (OGS) – to locate records of Ontario cemeteries, both currently and no longer in existence; cairns, family plots and burial registers
- Canadian County Atlas Digital Project – to locate early cemeteries

In this context, adjacent means contiguous or as otherwise defined in a municipal official plan.

4c. Does the property (or project area) contain a parcel of land that is in a Canadian Heritage River watershed?

The Canadian Heritage River System is a national river conservation program that promotes, protects and enhances the best examples of Canada's river heritage.

Canadian Heritage Rivers must have, and maintain, outstanding natural, cultural and/or recreational values, and a high level of public support.

For more information, contact the Canadian Heritage River System.

If you have questions regarding the boundaries of a watershed, please contact:

- your conservation authority
- municipal staff

4d. Does the property (or project area) contain a parcel of land that contains buildings or structures that are 40 or more years old?

A 40 year 'rule of thumb' is typically used to indicate the potential of a site to be of cultural heritage value. The approximate age of buildings and/or structures may be estimated based on:

- history of the development of the area
- fire insurance maps
- architectural style
- building methods

Property owners may have information on the age of any buildings or structures on their property. The municipality, local land registry office or library may also have background information on the property.

Note: 40+ year old buildings or structure do not necessarily hold cultural heritage value or interest; their age simply indicates a higher potential.

A building or structure can include:

- residential structure
- farm building or outbuilding
- industrial, commercial, or institutional building
- remnant or ruin
- engineering work such as a bridge, canal, dams, etc.

For more information on researching the age of buildings or properties, see the Ontario Heritage Tool Kit Guide Heritage Property Evaluation.

Part C: Other Considerations

5a. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) is considered a landmark in the local community or contains any structures or sites that are important to defining the character of the area?

Local or Aboriginal knowledge may reveal that the project location is situated on a parcel of land that has potential landmarks or defining structures and sites, for instance:

- buildings or landscape features accessible to the public or readily noticeable and widely known
- complexes of buildings
- monuments
- ruins

5b. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) has a special association with a community, person or historical event?

Local or Aboriginal knowledge may reveal that the project location is situated on a parcel of land that has a special association with a community, person or event of historic interest, for instance:

- Aboriginal sacred site
- traditional-use area
- battlefield
- birthplace of an individual of importance to the community

5c. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) contains or is part of a cultural heritage landscape?

Landscapes (which may include a combination of archaeological resources, built heritage resources and landscape elements) may be of cultural heritage value or interest to a community.

For example, an Aboriginal trail, historic road or rail corridor may have been established as a key transportation or trade route and may have been important to the early settlement of an area. Parks, designed gardens or unique landforms such as waterfalls, rock faces, caverns, or mounds are areas that may have connections to a particular event, group or belief.

For more information on Questions 5.a., 5.b. and 5.c., contact:

- Elders in Aboriginal Communities or community researchers who may have information on potential cultural heritage resources. Please note that Aboriginal traditional knowledge may be considered sensitive.
- municipal heritage committees or local heritage organizations
- Ontario Historical Society's "Heritage Directory" - for a list of historical societies and heritage organizations in the province

An internet search may find helpful resources, including:

- historical maps
- historical walking tours
- municipal heritage management plans
- cultural heritage landscape studies
- municipal cultural plans

Information specific to trails may be obtained through Ontario Trails.

APPENDIX B

Supplementary Documentation

Appendix B – Supplementary Screening Documentation

Screening Criteria	Results
PART A	
Has the property (or project area) been evaluated before and found not to be of cultural heritage value?	Individual properties within the study area may have been previously evaluated and determined not to be of cultural heritage value or interest but identifying each previously evaluated property was beyond the scope of this CHSR.
Is the property (or project area):	
identified, designated or otherwise protected under the *Ontario Heritage Act* as being of cultural heritage value?	Search of the City of Mississauga *Heritage Register,* identified: ▪ 8 designated properties under Part IV of the *Ontario Heritage Act* ▪ 1 protected heritage property designated under Part V of the *Ontario Heritage Act* ▪ 67 properties listed (not designated) on the City of Mississauga's *Heritage Register* under Section 27 of the *Ontario Heritage Act* ▪ 4 cultural heritage landscapes listed (not designated) on the City of Mississauga's *Inventory of Cultural Heritage Landscapes* under Section 27 of the *Ontario Heritage Act*
a National Historic Site (or part of)?	Search of the *Parks Canada Directory of Federal Heritage Designations* determined that no part of the study area is, or part, of a National Historic Site.
designated under the *Heritage Railways Stations Protection Act*?	Search of the *Parks Canada Directory of Federal Heritage Designations* determined that no part of the study area is designated under the *Heritage Railways Stations Protection Act.*
designated under the Heritage Lighthouse Protection Act?	No part of the study area is designated under the *Heritage Lighthouse Protection Act*.
identified as a Federal Heritage Building by the Federal Heritage Buildings Review Office (FHBRO)?	Search of the *Parks Canada Directory of Federal Heritage Designations* determined that no buildings in the study area is identified by FHBRO.

Screening Criteria	Results
located within a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site?	No part of the study area is located within a UNESCO World Heritage Site.
PART B	
Does the property (or project area) contain a parcel of land that:	
is the subject of a municipal, provincial or federal commemorative or interpretive plaque?	Search of the *Ontario Heritage Foundation Online Plaque Guide* and *Ontario's Historical Plaques* determined that there are no plaques within the study area.
has or is adjacent to a known burial and/or cemetery?	Desktop research identified: ▪ Trinity Anglican Church Cemetery, 26 Stavebank Road North
is in a Canadian Heritage River watershed?	Search of the Canadian Heritage River System online list determined the study area is not located within the watershed of a Canadian Heritage River.
contains buildings or structures that are 40 or more years old?	The study area was found to have 648 properties with buildings or structures that are 40 more years old through consultation with the City and review of the: ▪ *Ontario Historical County Maps Project Web Map Application* – Peel County ▪ 1962 and 1974 1:25,000 national topographic system (NTS) maps (Port Credit, Ontario Map Sheet 030M12A and 030M11D) available through the online *Historical Topographic Map Digitization Project* ▪ Pre-1980 aerial imagery accessed through the City of Mississauga *Interactive Online Mapping Service* ▪ Google aerial and Street View imagery
PART C	
Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area):	
is considered a landmark in the local community or contains any structures or sites that are important in defining the character of the area?	Municipal consultation and review of municipal heritage databases determined that the study area contains numerous landmarks or structures important in defining the character of the area.

Screening Criteria	Results
has a special association with a community, person or historical event?	Municipal consultation and review of municipal heritage databases determined that numerous built heritage resources and cultural heritage landscapes within the study area have special association with a community, person, or historical event.
contains or is part of a cultural heritage landscape?	Municipal consultation and review of municipal heritage databases determined that the study area includes portions of the: ▪ Mineola Neighbourhood Cultural Heritage Landscape (listed on the City *Inventory of Cultural Heritage Landscapes*) ▪ Old Port Credit Village Heritage Conservation District (designated, Part V of the *OHA*) ▪ Old Port Credit Cultural Heritage Landscape (listed on the City *Inventory of Cultural Heritage Landscapes*) ▪ Port Credit Harbour Cultural Heritage Landscape (listed on the City *Inventory of Cultural Heritage Landscapes*) ▪ Adamson Estate Cultural Heritage Landscape (listed on the City *Inventory of Cultural Heritage Landscapes*) ▪ potential cultural heritage landscape of the former Hamilton and Toronto Railway line.

Disclamiers

WSP Canada Inc. (“WSP”) prepared this report solely for the use of the intended recipient, GM BluePlan Engineering Limited, in accordance with the professional services agreement between the parties. In the event a contract has not been executed, the parties agree that the WSP General Terms for Consultant shall govern their business relationship which was provided to you prior to the preparation of this report.

The report is intended to be used in its entirety. No excerpts may be taken to be representative of the findings in the assessment.

The conclusions presented in this report are based on work performed by trained, professional and technical staff, in accordance with their reasonable interpretation of current and accepted engineering and scientific practices at the time the work was performed.

The content and opinions contained in the present report are based on the observations and/or information available to WSP at the time of preparation, using investigation techniques and engineering analysis methods consistent with those ordinarily exercised by WSP and other engineering/scientific practitioners working under similar conditions, and subject to the same time, financial and physical constraints applicable to this project.

WSP disclaims any obligation to update this report if, after the date of this report, any conditions appear to differ significantly from those presented in this report; however, WSP reserves the right to amend or supplement this report based on additional information, documentation or evidence.

WSP makes no other representations whatsoever concerning the legal significance of its findings.

The intended recipient is solely responsible for the disclosure of any information contained in this report. If a third party makes use of, relies on, or makes decisions in accordance with this report, said third party is solely responsible for such use, reliance or decisions. WSP does not accept responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken by said third party based on this report.

WSP has provided services to the intended recipient in accordance with the professional services agreement between the parties and in a manner consistent with that degree of care, skill and diligence normally provided by members of the same profession performing the same or comparable services in respect of projects of a similar nature in similar circumstances. It is understood and agreed by WSP and the recipient of this report that WSP provides no warranty, express or implied, of any kind. Without limiting the generality of the foregoing, it is agreed and understood by WSP and the recipient of this report that WSP makes no representation or warranty whatsoever as to the sufficiency of its scope of work for the purpose sought by the recipient of this report.

In preparing this report, WSP has relied in good faith on information provided by others, as noted in the report. WSP has reasonably assumed that the information provided is correct and WSP is not responsible for the accuracy or completeness of such information.

Benchmark and elevations used in this report are primarily to establish relative elevation differences between the specific testing and/or sampling locations and should not be used for other purposes, such as grading, excavating, construction, planning, development, etc.

The original of this digital file will be kept by WSP for a period of not less than 10 years. As the digital file transmitted to the intended recipient is no longer under the control of WSP, its integrity cannot be assured. As such, WSP does not guarantee any modifications made to this digital file subsequent to its transmission to the intended recipient.

This limitations statement is considered an integral part of this report.

Executive Summary

WSP Canada Inc. (WSP) has been retained by GM BluePlan Engineering Limited on behalf of the Region of Peel to undertake a Cultural Heritage Report: Existing Conditions and Preliminary Impact Assessment (Cultural Heritage Report) as a part of the Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Municipal Class Environmental Assessment, in Mississauga, Ontario.

The Study Area is situated within Parts of Lots 1, 2, 3 and 4 Concession 2 South of Dundas Street, Part of Lots 1, 2, 3 and 4 Concession 3 South of Dundas Street in the Township of Toronto, County of Peel, now the City of Mississauga (Figure 1). The Study Area is generally limited by Front Street in the south, Veronica Drive and just east of Forest Avenue in the west, Seneca Avenue in the north, and Lake Ontario in the east in the City of Mississauga.

This Cultural Heritage Report identifies existing and potential Built Heritage Resources (BHRs) and Cultural Heritage Landscapes (CHLs) within the Study Area. Further, the report includes a review of the background history of the Study Area, the results of a property visit undertaken to confirm existing conditions, a preliminary impact assessment to identify negative impacts to BHRs and CHLs, preliminary mitigation recommendations, and determination of whether a Cultural Heritage Evaluation Report (CHER) or Heritage Impact Assessment (HIA) is required for all or parts of the Study Area to be impacted.

The cultural heritage identification and evaluation documented in this Cultural Heritage Report follows the process set out in the Draft Existing Conditions and Preliminary Impact Assessment Report Guidelines provided by the Ministry of Citizenship and Multiculturalism (MCM, 2019). In addition, best practice in heritage identification and assessment has been used, as outlined in the Standards and Guidelines for the Conservation of Provincial Heritage Properties (MCM, 2010), Identification and Evaluation Process (2014) and the Ontario Heritage Toolkit (2006a).

This Cultural Heritage Report was prepared by Joel Konrad, PhD, CAHP, Cultural Heritage Lead, Ontario and Claire Forward BA (Hons.), MA, MSc, Cultural Heritage Specialist. A property visit was conducted on March 15, 2023, which confirmed that there are three (**3**) cultural heritage landscapes (CHLs), (**1**) Heritage Conservation District (HCD), and (**25**) built heritage resources (BHRs) with known or potential cultural heritage value or interest (CHVI) within the Study Area.

Based on the results of the background data collection and assessment of impacts of the Study Area and proposed works, the following recommendations were developed:

1) Staging and construction activities should be appropriately located and/or planned to avoid impacts to the identified BHRs, CHLs, and the HCD.

2) Vibration impacts are anticipated for twenty-three (23) heritage resources: BHR 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, and 25. During adjacent construction or excavation, vibration impacts will be monitored, and work will stop immediately if vibration thresholds are exceeded.

3) No anticipated direct or indirect impacts were identified for three (3) heritage resources: BHR 1 and 2, and CHL 3. No further heritage reporting is required for these resources at this time.

4) Heritage Impact Assessments (HIAs) are recommended for three (3) heritage resources: CHL 1 and 2, and HCD 1. These resources are designated and will experience impacts to their properties as a result of the Project's undertaking. As such, HIAs are recommended to understand and identify the impacts to the cultural heritage attributes, and to recommend appropriate mitigative measures to reduce or remove the impact to the resources.

5) Should future work require expansion of the Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Municipal Class EA Study Area, a qualified heritage consultant should be contacted to confirm the impacts of the proposed work on known or potential BHRs, CHLs, and HCD.

1.0 INTRODUCTION

1.1 Study Purpose and Objectives

On behalf of the Region of Peel (the Region), GM BluePlan Engineering Limited (GMBP) retained WSP to undertake a Cultural Heritage Report: Existing Conditions and Preliminary Impact Assessment (Cultural Heritage Report) as a part of the Port Credit East Water and Wastewater Servicing Optimization Strategy Municipal Schedule 'C' Municipal Class Environmental Assessment, in Mississauga, Ontario.

In September 2022, WSP/Golder Associates (WSP Golder) had been retained by GMBP on behalf of the Region to produce an addendum for the November 2020 Cultural Heritage Screen Report (Golder, 2020) and subsequent May 2020 Technical Memorandums for the Elmwood and Hiawatha study areas (Golder, 2020), based on an updated overall Study Area for the Schedule 'C' Municipal Class Environmental Assessment for the Port Credit East Water and Wastewater Servicing Optimization Strategy (the Project) in the City of Mississauga, Region of Peel, Ontario.

The November 2020 addendum considered a larger study area that was established before any detail design decision was made. This Cultural Heritage Report will only cover the areas identified in the detail design that will have the most impact (the Study Area): the Hiawatha SPS, Elmwood SPS, Rosemere SPS, and Front Street SPS.

The Study Area is situated within Parts of Lots 1, 2, 3 and 4 Concession 2 South of Dundas Street, Part of Lots 1, 2, 3 and 4 Concession 3 South of Dundas Street in the Township of Toronto, County of Peel, now the City of Mississauga (Figure 1).

This Cultural Heritage Report was undertaken to identify municipally, provincially, and federally recognized heritage properties as well as potential heritage properties within the Study Area and assess the impacts that the Project may have on cultural heritage resources.

A Cultural Heritage Report is required for the MCEA process to: identify existing and potential built heritage resources (BHR) and cultural heritage landscapes (CHL); review the background history of the Study Area; complete a site visit to confirm existing conditions; provide a preliminary impact assessment to conserve BHRs and CHLs; identify mitigation and/or monitoring for potential impacts; and determine whether additional heritage reporting is required.

To meet these objectives, the report will:

- Introduce the study including the purpose and methodology used to undertake the work.
- Review background studies to complete a summary history of the Study Area using local histories, historical mapping and aerial photographs. This work will trace the evolution of the Study Area and aid in the identification of existing and potential BHRs and CHLs.
- Obtain information regarding the City of Mississauga's heritage recognitions and identification of listed and/or designated heritage properties within the Study Area.
- Confirm the presence of previously recognized built heritage resources and cultural heritage landscapes. This process will aid in the identification of built heritage resources and cultural heritage landscapes that may be impacted by the undertaking. This task will include a review of municipal, provincial, and federal heritage registers and inventories, including the City of Mississauga's Heritage Register.

This work will be conducted in accordance with the *Ontario Heritage Act* (OHA, 2005), the *Provincial Policy Statement* (2020), and the *Town of Caledon's Official Plan* (2018).

1.2 Project Description and Study Area

The existing sanitary pumping stations (Rosemere, Elmwood, and Hiawatha) and some of the sanitary sewer mains and watermains in the general Port Credit East area are experiencing operational challenges. In order to develop an integrated and optimized servicing strategy to meet existing and future growth, the Region has initiated a Schedule 'C' Municipal Class Environmental Assessment (EA) for this infrastructure.

After a comprehensive evaluation process, the preliminary preferred option was selected for each of the following project components:

- New Lakeshore Road Deep Trunk Sewer: Tunnel from Marina Park east to the municipal parking lot at Elmwood Avenue North and Lakeshore Road. Temporary parking lot proposed at Harold E. Kennedy Park during construction.
- New Lakeshore Road Sub-Transmission Watermain: Shared shafts and construction compounds from Marina Park to parking lot corner of Elmwood Avenue North and Lakeshore Road.
- Rosemere Sewage Pumping Station: New Rosemere SPS and twin forcemains East to Vesta Drive along Sandham Road.
- Elmwood and Hiawatha Sewage Pumping Stations: Decommission both SPS's and connect to Lakeshore Road Trunk Sewer.

The Study Area is generally limited by Front Street in the south, Veronica Drive and just east of Forest Avenue in the west, Seneca Avenue in the north, and Lake Ontario in the east in the City of Mississauga (Figure 1).

2.0 LEGISLATIVE FRAMEWORK

This report reviews BHRs and CHLs within the Study Area to ensure that the Project takes into consideration these resources. This section outlines the various legislative frameworks and policies relevant to the report.

2.1 United Nations Declaration on the Rights of Indigenous Peoples

On June 21st, 2021, the Canadian federal government enacted United Nations Declaration on the Rights of Indigenous Peoples Act and confirmed that the United Nations Declaration on the Rights of Indigenous Peoples (Declaration - 2007) "must be implemented in Canada." As a result, Indigenous peoples in Canada are recognized as having unique rights, including those that pertain to the conservation of Indigenous heritage. As per Articles 11 and 31 of the Declaration:

> 11. 1) Indigenous peoples have the right to practice and revitalize their cultural traditions and customs. This includes the right to maintain, protect and develop the past, present and future manifestations of their cultures, such as archaeological and historical sites, artefacts, designs, ceremonies, technologies and visual and performing arts and literature.
>
> 31. 1) Indigenous peoples have the right to maintain, control, protect and develop their cultural heritage, traditional knowledge and traditional cultural expressions, as well as the manifestations of their sciences, technologies and cultures, including human and genetic resources, seeds, medicines, knowledge of the properties of fauna and flora, oral traditions, literatures, designs, sports and traditional games and visual and performing arts. They also have the right to maintain, control, protect and develop their intellectual property over such cultural heritage, traditional knowledge, and traditional cultural expressions.
>
> 2) In conjunction with Indigenous peoples, States shall take effective measures to recognize and protect the exercise of these rights.

These rights to historical sites, ceremonies, cultural traditions, etc. (collectively understood as Indigenous heritage) are pertinent to the Environmental Assessment process through Articles 25 and 26 of the Declaration, which state that:

> 25. Indigenous peoples have the right to maintain and strengthen their distinctive spiritual relationship with their traditionally owned or otherwise occupied and used lands, territories, waters and coastal seas and other resources and to uphold their responsibilities to future generations in this regard.
>
> 26. 1) Indigenous peoples have the right to the lands, territories and resources which they have traditionally owned, occupied or otherwise used or acquired.
>
> 2) Indigenous peoples have the right to own, use, develop and control the lands, territories and resources that they possess by reason of traditional ownership or other traditional occupation or use, as well as those which they have otherwise acquired.
>
> 3) States shall give legal recognition and protection to these lands, territories and resources. Such recognition shall be conducted with due respect to the customs, traditions, and land tenure systems of the Indigenous peoples concerned.

2.2 Provincial Policy Statement

The *Provincial Policy Statement* (PPS) (2020) outlines provincial "policy direction on matters of provincial interest related to land use planning and development" (Part I: Preamble PPS 2020). The intent is to provide for appropriate development that protects resources of public interest, public health and safety and the quality of the natural and built environment. The PPS 2020 identifies the conservation of significant built heritage resources and cultural heritage landscapes as a provincial interest in Section 2.6.1.

Relevant definitions from the PPS 2020 include:

Built Heritage Resources (BHR): means a building, structure, monument, installation or any manufactured or constructed part or remnant that contributes to a property's cultural heritage value or interest as identified by a community, including an Indigenous community. *Built heritage resources* are located on property that may be designated under Parts IV or V of the OHA, or that may be included on local, provincial, federal and/or international registers.

Cultural Heritage Landscapes (CHL): means a defined geographical area that may have been modified by human activity and is identified as having cultural heritage value or interest by a community, including an Indigenous community. The area may include features such as buildings, structures, spaces, views, archaeological sites or natural elements that are valued together for their interrelationship, meaning or association. *Cultural heritage landscapes* may be properties that have been determined to have cultural heritage value or interest under the OHA, or have been included on federal and/or international registers, and/or protected through official plan, zoning by-law, or other land use planning mechanisms.

Conserved: means the identification, protection, management and use of *built heritage resources*, *cultural heritage landscapes* and *archaeological resources* in a manner that ensures their cultural heritage value or interest is retained. This may be achieved by the implementation of recommendations set out in a conservation plan, archaeological assessment, and/or heritage impact assessment that has been approved, accepted or adopted by the relevant planning authority and/or decision-maker. Mitigative measures and/or alternative development approaches can be included in these plans and assessments.

2.3 Ontario Heritage Act

The OHA (2005) gives municipalities and the provincial government powers to preserve the heritage of Ontario, with a primary focus on protecting heritage properties and archaeological sites. The OHA grants the authority to municipalities and to the province to identify and designate properties of heritage significance, provide standards and guidelines for the preservation of heritage properties and enhance protection of heritage conservation districts, marine heritage sites and archaeological resources.

Designation ensures the conservation of important places and can take the form of individual designations (Part IV of the OHA) or as part of a larger group of properties, known as a Heritage Conservation District (Part V of the OHA). An evaluation using the criteria outlined in Ontario Regulation (O. Reg) 9/06 is used to determine whether a property possesses cultural heritage value or interest and may be worthy of designation under the OHA. Designation offers protection for properties under Sections 33, 34 and 42 of the OHA, prohibiting the owner of a designated property from altering, demolishing or removing a building or structure on the property unless the owner applies to the council of the municipality and receives written consent to proceed with the alteration, demolition or removal.

In addition to designated properties, the OHA allows municipalities to list properties that are considered to have cultural heritage value or interest on their Municipal Heritage Register. Under Part IV, Section 27 of the OHA, municipalities must maintain a Register of properties situated in the municipality that are of cultural heritage value or interest. Section 27 (1.1) states that the register shall be kept by the clerk and that it must list all designated properties (Part IV and V). Under Section 27 (1.2), the Register may include property that has not been designated, but that council believes to be of cultural heritage value or interest. Listed properties, although recognized as having cultural heritage value or interest, are not protected under the OHA to the same extent as designated properties, but are acknowledged under Section 2 of the PPS 2020 under the *Planning Act*. An owner of a listed heritage property must provide the municipality with 60 days' notice of their intention to demolish a building or structure on the property.

The OHA also allows for the designation of provincial heritage properties (PHP). Part III.1 of the OHA enables the preparation of standards and guidelines that set out the criteria and process for identifying the cultural heritage value or interest of PHPs (Part II of the OHA) and cultural heritage value or interest of provincial heritage properties of provincial significance (PHPPS) (Ontario Regulation (O. Reg.) 10/06 of the OHA) and to set standards for their protection, maintenance, use, and disposal.

2.3.1 Ontario Regulation 9/06

The criteria for deterimining cultural heritage value or interest is defined in O. Reg. 9/06. This regulation was created to ensure a consistent approach to the designation of heritage properties under the OHA. All designations under the OHA made after 2006 must meet the criteria outlined in the regulation.

A property may be designated under Section 29 of the OHA if it meets one or more of the following criteria for determining whether it is of cultural heritage value or interest:

1) The property has design value or physical value because it,

i) is a rare, unique, representative or early example of a style, type, expression, material or construction method,

ii) displays a high degree of craftsmanship or artistic merit, or

iii) demonstrates a high degree of technical or scientific achievement.

6) The property has historical value or associative value because it,

i) has direct associations with a theme, event, belief, person, activity, organization or institution that is significant to a community,

ii) yields, or has the potential to yield, information that contributes to an understanding of a community or culture, or

iii) demonstrates or reflects the work or ideas of an architect, artist, builder, designer or theorist who is significant to a community.

7) The property has contextual value because it,

i) is important in defining, maintaining or supporting the character of an area,

ii) is physically, functionally, visually or historically linked to its surroundings, or,

iii) is a landmark.

2.4 Region of Peel's Official Plan

The Region of Peel's Official Plan (2022) is currently awaiting Provincial approval. The 1996 Region of Peel Official Plan as amended (2021) consists of policies for the sustainable development of the Region (Caledon, Brampton, and Mississauga).

Section 3.6, Cultural Heritage, addresses cultural heritage features, structures, archaeological resources, and cultural heritage landscapes in Peel according to the criteria and guidelines established by the Province. Relevant policies include:

3.6.2.5 Direct the area municipalities to require, in their official plans, that the proponents of development proposals affecting heritage resources provide for sufficient documentation to meet Provincial requirements and address the Region's objectives with respect to cultural heritage resources.

3.6.2.6 Encourage and support the area municipalities in preparing, as part of any area municipal official plan, an inventory of cultural heritage resources and provision of guidelines for identification, evaluation and impact mitigation activities.

2.5 City of Mississauga's Official Plan

The Mississauga Official Plan was approved by the Region of Peel on October 5, 2011 and was consolidated on October 21, 2021. Section 7.4 of the Mississauga Official Plan provides policies specific to heritage planning.

Relevant policies include:

7.4.1.2 Mississauga will discourage the demolition, destruction or inappropriate alteration or reuse of cultural heritage resources.

7.4.1.3 Mississauga will require development to maintain locations and settings for cultural heritage resources that are compatible with and enhance the character of the cultural heritage resource.

7.4.1.11 Cultural heritage resources designated under the Ontario Heritage Act, will be required to preserve the heritage attributes and not detract or destroy any of the heritage attributes in keeping with the Ontario Heritage Tool Kit, the Ontario Ministry of Culture, and the Standards and Guidelines for the Conservation of Historic Places in Canada, Parks Canada.

7.4.1.12 The proponent of any construction, development, or property alteration that might adversely affect a listed or designated cultural heritage resource or which is proposed adjacent to a cultural heritage resource will be required to submit a Heritage Impact Assessment, prepared to the satisfaction of the City and other appropriate authorities having jurisdiction.

7.4.1.14 Cultural heritage resources will be integrated with development proposals.

7.4.1.17 Public works will be undertaken in a way that minimizes detrimental impacts on cultural heritage resources.

7.4.2.3 Development adjacent to a cultural heritage property will be encouraged to be compatible with the cultural heritage property.

2.5.1 Port Credit Local Area Plan

The Study Area is partly located within the Port Credit Local Plan Area. The plan covers an array of topics including: historical context, current context, collaboration, vision, direct growth, valuing the environment, completing communities, multi-modal city, desirable urban form, and strong economy. The plan concludes with an Appendix for the Port Credit Built Form Guide.

In Section 8.2, the plan describes the cultural heritage and features of the area including the Old Port Credit Village Heritage Conservation District. Other relevant policies include:

10.3.2.1 Any additions, alterations, adaptive reuse or redevelopment [to the Old Port Credit Village Heritage Conservation District Precinct] will address how the development:

- Displays massing and scale sympathetic to surroundings;
- Preserves the historic housing stock;
- Supports the existing historical character;
- Maintains the existing street grid pattern and building setbacks; and
- Maintains and enhances significant groupings of trees and mature vegetation

In Appendix 1, the Port Credit Built Form Guide, built form guidelines for cultural heritage resources are described in Section 3.4:

> There are a number of heritage resources in the Port Credit Neighbourhoods. Designated properties are to be retained. The retention and enhancement of heritage listed properties is strongly encouraged.
>
> New development proposed in proximity to these buildings should be developed in a manner that is sensitive and complimentary to the character of the structure.
>
> New developments should provide the appropriate transition to properties listed on the heritage register and in the Historic Village of Port Credit Precinct.

2.5.2 Port Credit Village Heritage Conservation District Plan

In 1986, the City of Mississauga approved the Port Credit District Plan (not a Heritage Conservation District). In 1988, the City of Mississauga identified the Old Port Credit village south of Lakeshore Road West by by-law as an area to be examined for a possible future designation.

In 1997, the Port Credit District policies in the official plan came into effect. These policies referred to the “character area” of the Historical Port Credit area, and delineated the same area identified in 1988. These policies reiterated the City’s intention to examine the area for a possible designation under Part V of the *Ontario Heritage Act*.

A Heritage Conservation Feasibility Study of Old Port Credit Village was completed in 2003 which recommended the preparation of a Heritage Conservation District (HCD) plan. The current HCD plan was approved by the Ontario Municipal Board in 2004 and was amended in 2018. The HCD’s heritage attributes are:

a) Property boundaries conform to the government's planned village survey dated 1835;

b) Human use and activity predate the government's village survey by many thousands of years;

c) Urban form is defined by the original grid of streets, by the Credit River and by J.C. Saddington Park;

d) The urban fabric is primarily comprised of a low-rise built form with modest building footprints relative to lot size;

e) A number of institutional landmarks important to Port Credit's history remain;

f) A number of historic buildings, built as houses and converted to commercial use or built with a public function in mind, but now used as houses remain;

g) Other houses of historic interest are modest vernacular dwellings;

h) Front yards consist of maintained landscaping of lawns and ornamental gardens with a variety of deciduous and coniferous specimen trees. Parking is generally provided in a single car width driveway often leading to a rear yard garage.

i) Views of Credit River and Lake Ontario from Lakeshore Road West and from within the District;

j) Views from Lake Ontario and the mouth of the Credit River harbour north to Lakeshore Road West, including both sides of the harbour.

Not only do the policies in the HCD plan apply to private property owners, but to publicly owned land, including the City's public works projects in parks and on streets.

General policies of this plan intend to conserve the HCD's heritage character and attributes and primarily apply to alterations of buildings or landscape in the district. Policies relevant to this project in public lands are:

12.1.1 City will maintain the existing street grid, and will consider the feasibility of incorporating the historical pattern of wide grass boulevards with random street tree planting in any plan for streetscape improvement.

12.1.2 The City will consider the following streetscaping measures to better reflect the previously-existing landscape features:

a) Narrowing of the streets with landscaped 'bump-outs' and defined areas for on-street parking subject to the City's Traffic Calming Policy.

12.1.3 The City will protect trees in the public right-of-way.

12.2.1 Street trees and boulevards

a) The municipality is responsible for the public works within the road right-of-way and for the open space parkland. The planting and maintenance of the trees make a significant contribution to the heritage landscape character of the District.

b) The majority of trees are mature, wide-canopy deciduous trees – primarily silver maple, red oak, sugar maple, horse chestnut, catalpa, ash and mountain ash. These species have green foliage in the

summer and colourful reds, yellows and golds in the fall. Many of the trees are located adjacent to the sidewalk at the property line.

c) Existing trees should be monitored on a regular basis to ensure that they remain healthy. Pruning of dieback, fertilization and pesticide treatments should be undertaken as required to preserve the existing trees.

d) As trees mature and replanting is required, the selection of the species should re-establish the form and character of the existing streetscape. Where possible, the new trees should be large-canopied, green foliage deciduous trees.

e) Undertakings such as road improvements and infrastructure upgrades should be assessed prior to the start of construction to determine if they will negatively affect the existing trees. It may not be possible to incorporate underground electrical services until such time that street trees are being replaced, due to the possibility of damage to trees and root systems.

f) The feasibility of adding a grass boulevard and planting appropriate large-canopy trees, randomly spaced, should be investigated as part of future infrastructure and streetscape improvement initiatives.

Section 17.5 b) identifies that installation and/or repair of underground utilities or services including sewage, does not require a permit under Section 42 of the *Ontario Heritage Act*.

3.0 METHODOLOGY

3.1 Consultation

BHRs and CHLs already recognized by the municipality, the Ontario Heritage Trust (OHT), provincially and federally were identified by reviewing the following:

- The inventory of OHT easements;
- The OHT's Ontario Heritage Plaque Guide, an online, searchable database of Ontario Heritage Plaques;
- Ontario's Historical Plaques website;
- The Ontario Genealogical Society's Ontario Cemetery Index
- Parks Canada's Historic Places website, an online, searchable register that provides information on historic places recognized at the local, provincial/territorial and national levels;
- Parks Canada's Directory of Federal Heritage Designations, a searchable on-line database that identifies National Historic Sites, National Historic Events, National Historic People, Heritage Railway Stations, Federal Heritage Buildings and Heritage Lighthouses;
- Canadian Heritage River System, a national river conservation program that promotes, protects and enhances the best examples of Canada's river heritage; and,
- UNESCO World Heritage Sites.

In addition, the mapping tool on the Town of Caledon's website was consulted to review the properties included on their Heritage Register in the Study Area.

For the purposes of this study, any property previously identified by a municipality, municipal staff, provincial or federal agencies as containing, or having the potential to contain, cultural heritage value or interest (CHVI) will be determined to be a BHR or CHL, and if applicable, will be discussed in Section 5.4.

3.2 Field Assessment

Field assessment for this report included a survey of the cultural heritage Study Area from the publicly accessible right-of-way to confirm or identify existing and/or potential BHRs and CHLs. Where identified, potential resources were photographed and mapped, and physical characteristics visible from the right-of-way or aerial imagery were described.

The use of a 40-year-old threshold is a guiding principle when conducting a preliminary identification of cultural heritage resources (MCM, 2016). While identification of a resource that is 40 years old or older does not confer outright heritage significance, this threshold provides a means to collect information about resources that may retain heritage value.

Similarly, if a resource is younger than 40 years old it does not preclude this resource from having CHVI, however it does provide a systematic means of identifying properties that have a higher likelihood of retaining cultural heritage value.

This report includes background research that summarizes the history of the Study Area. In addition to textual sources, historical mapping and aerial photography was consulted to identify the presence of structures/building, settlement patterns and other previously recognized BHRs and CHLs.

3.3 Identification of Cultural Heritage Value or Interest

Properties identified during field review were screened by employing an application of the 40-year threshold used to identify potential BHRs and/or CHLs, followed by a high-level and cursory assessment based on a theoretical understanding of the criteria outlined in O. Reg. 9/06 for determining CHVI (see Section 2.3.1 for full criteria). The criteria in O. Reg. 9/06 were established to identify properties with sufficient CHVI to warrant designation under the OHA. It is considered best practice when identifying potential BHRs and CHLs to employ O. Reg. 9/06 as it provides a general framework for understanding and interpreting heritage value. It should be noted, however, that the application of this framework is used as a theoretical underpinning, not as a strict measurement applied, to a greater or lesser degree, to each property under study. This report does not provide a comprehensive evaluation of a property according to O. Reg. 9/06 and does not satisfy the requirement for a Cultural Heritage Evaluation Report (CHER).

3.4 Agency Data Requests

A request was sent to the City of Mississauga on March 13, 2023 to confirm if any properties within the Study Area had been previously identified or designated. A response was received on March 21, 2023 indicating that there are a large number of designated and listed properties in the Study Area and in order to receive all the details of the heritage properties contact the Geomatics team. An additional correspondence from the Geomatics team was received on March 27, 2023 that included the City of Mississauga GIS mapping that showed all of the heritage properties within the Study Area. These properties are listed in Section 5.4.

A request was sent to the Ontario Heritage Trust (OHT) on March 13, 2023 to obtain information related to OHT easements and owned properties. A response was received on March 14, 2023 confirming that the OHT does not have any conservation easements or Trust-owned properties within or adjacent to the Study Area.

A request was sent to the Ministry of Citizenship and Multiculturalism (MCM) on March 13, 2023 to confirm if any provincial heritage properties (PHPs) were located within the Study Area. A response was received on March 24, 2023 confirming that no properties have been designated by the Minister in the Study Area, nor is the MCM aware of any PHPs located within or adjacent to the Study Area. However, the Credit River Bridge (Mile 13.27 Lakeshore West Corridor LSW, Aka. Former CN Rail Bridge over Credit River) and Mississauga Road Bridge (Mile 13.39 LSW) are in proximity to the Study Area, but not within or adjacent.

A summary of data requested through consultation with the agencies noted above is provided in Table 3-1.

Table 3-1: Agency Data Requests

Contact Name / Position	Organization	Contact Information	Dates of Communication	Description of Information Received
Andrew Douglas, Heritage Planner	City of Mississauga	Andrew.douglas@mississauga.ca	Sent: March 13, 2023 Received: March 21 and 27, 2023	Mr. Douglas indicated that there are several designated heritage properties in the Study Area. He also indicated that there are several listed properties and to reach out to the Geomatics team to receive all the details of all the heritage properties. The Geomatics team replied and shared the City of Mississauga GIS mapping that covered all the heritage properties in the Study Area, which have been listed in section 5.4.
Kevin Baksh, OHT Registrar	OHT	kevin.baksh@heritagetrust.on.ca	Sent: March 13, 2023 Received: March 14, 2023	Mr. Baksh confirmed that the OHT does not have any conservation easements or Trust-owned properties within or adjacent to the Study Area.
Karla Barboza, Heritage Planner	MCM	karla.barboza@ontario.ca	Sent: March 13, 2023 Received: March 24, 2023	Ms. Barboza confirmed that there are no properties designated by the Minister in the Study Area, nor is the MCM aware of any PHPs within or adjacent to the Study Area. She also indicated that the Credit River Bridge (Mile 13.27 Lakeshore West Corridor LSW, Aka. Former CN Rail Bridge over Credit River) and Mississauga Road Bridge (Mile 13.39 LSW) are in proximity to the Study Area, but not within or adjacent.

4.0 HISTORICAL CONTEXT

4.1 Historical Context Overview

The Study Area is situated within Parts of Lots 1, 2, 3 and 4 Concession 2 South of Dundas Street, Part of Lots 1, 2, 3 and 4 Concession 3 South of Dundas Street in the Township of Toronto, County of Peel, now the City of Mississauga. The following provides a generalized cultural history of the Indigenous people within the Study Area's surroundings.

The sections below present a sequence of Indigenous land-use for the region from the earliest known human occupation following deglaciation, as well as more recent Euro-Canadian land-use history in the region. These periods are the Pre-Contact period and the Post-Contact (Historic) period.

4.1.1 Pre-Contact Period

The pre-contact period in Ontario has been reconstructed, primarily, from the archaeological record and interpretations made by archaeologists through an examination of material culture and site settlement patterns. Technological and temporal divisions of the pre-contact period have been defined by archaeologists based on changes to natural, cultural, and political environments that are observable in the archaeological record. It is pertinent to state that although these divisions provide a generalized framework for understanding the broader events of the pre-contact period, they are not an accurate reflection of the fluidity and intricacies of cultural practices that spanned thousands of years. The following presents a sequence of Indigenous land-use from the earliest human occupation following deglaciation to the more recent past based on the following periods as defined by archaeologists:

- The Paleo Period
- The Archaic Period
- The Woodland Period

Paleo Period

Paleo period populations were the first to occupy what is now southern Ontario, moving into the region following the retreat of the Laurentide Ice Sheet approximately 11,000 years before present (BP). The first Paleo period populations to occupy southern Ontario are referred to by archaeologists as Early Paleo (Ellis & Deller, 1990).

Early Paleo period groups are identified by their distinctive projectile point morphological types, exhibiting long grooves, or 'flutes', that likely functioned as a hafting mechanism (method of attaching the point to a wooden shaft). These Early Paleo group projectile point types include Gainey (ca. 10,900 BP), Barnes (ca. 10,700), and Crowfield (ca. 10,500) (Ellis & Deller, 1990). By approximately 10,400 BP, Paleo projectile points transitioned to various unfluted varieties, such as Holcombe (ca. 10,300 BP), Hi Lo (ca. 10,100 BP), and Unstemmed and Stemmed Lanceolate (ca. 10,400 to 9,500 BP). These tool types were used by Late Paleo period groups (Ellis & Deller, 1990). Both Early and Late Paleo period populations were highly mobile, participating in the hunting of large game animals. Paleo period sites often functioned as small campsites where stone tool production and maintenance occurred (Ellis & Deller, 1990).

Archaic Period

By approximately 8,000 BP, climatic warming supported the growth of deciduous forests in southern Ontario. These forests introduced new flora and faunal resources, which resulted in subsistence shifts and a number of cultural adaptations. This change is reflected in the archaeological record by new tool-kits that are reflective of a shift in subsistence strategies and has been categorized as the Archaic period.

The Archaic period in southern Ontario is sub-divided into the Early Archaic (ca. 10,000 to 8,000 BP), Middle Archaic (ca. 8,000 to 4,500 BP), and the Late Archaic (ca. 4,500 to 2,800 BP) periods. Generally, in North America, the Archaic period represents a transition from big game hunting to broader, more generalized subsistence strategies based on local resource availability. This period is characterized by the following traits:

- An increase in stone tool variation and reliance on local stone sources,
- The emergence of notched and stemmed projectile point types,
- A reduction in extensively flaked tools,
- The use of native copper,
- The use of bone tools for hooks, gorges, and harpoons,
- An increase in extensive trade networks, and
- The production of ground stone tools and an increase in larger, less portable tools.

The Archaic period is also marked by population growth with archaeological evidence suggesting that, by the end of the Middle Archaic period (ca. 4,500 BP), populations had steadily increased in size (Ellis, et al., 1990).

Over the course of the Archaic period, populations began to rely on more localized hunting and gathering territories and were shifting to more seasonal encampments. From the spring into the fall, settlements were focused in lakeshore/riverine locations where a variety of different resources could be exploited. Settlement in the late fall and winter months moved to interior sites where the focus shifted to deer hunting and the foraging of wild plants (Ellis et al., 1990). The steady increase in population size and the adoption of a more localized seasonal subsistence strategy led to the transition into the Woodland period.

Early and Middle Woodland Periods

The beginning of the Woodland period is defined by the emergence of ceramic technology. Similar to the Archaic period, the Woodland period is separated into three timeframes: the Early Woodland (ca. 2,800 to 2,000 BP), the Middle Woodland (ca. 2,000 to 1,200 BP), and the Late Woodland (ca. 1,200 to 350 BP) (Spence et al., 1990; Fox, 1990).

The Early Woodland period is represented in southern Ontario by two cultural complexes: the Meadowood Complex (ca. 2,900 to 2,500 BP), and the Middlesex Complex (ca. 2,500 to 2,000 BP). During this period, the life ways of Early Woodland populations differed little from that of the Late Archaic with hunting and gathering representing the primary subsistence strategies. The pottery of this period is characterized by its relatively crude construction and lack of decoration. These early ceramics exhibit cord impressions, which are likely the result of the techniques used during manufacture rather than decoration (Spence et al., 1990).

The Middle Woodland period has been differentiated from the Early Woodland period by changes in lithic tool forms (e.g. projectile points, expedient tools), and the increased decorative elaboration of ceramic vessels (Spence et al., 1990). Additionally, archaeological evidence suggests the rudimentary use of maize (corn) horticulture by the end of the Middle Woodland Period (Warrick, 2000).

In southern Ontario, the Middle Woodland has been divided into three different complexes based on regional cultural traditions: the Point Peninsula Complex, the Couture Complex, and the Saugeen Complex. These groups are differentiated by sets of characteristics that are unique to regions within the province, specifically regarding ceramic decorations.

The Point Peninsula Complex extends from south-central and eastern Ontario into southern Quebec. The northernmost borders of the complex can be found along the Mattawa and French Rivers. Ceramics are coil constructed with conical bases, outflaring rims, and flat, rounded, or pointed lips. The interior surfaces of vessels are often channelled with a comb-like implement, creating horizontal striations throughout. The exterior is smoothed, or brushed, and decoration generally includes pseudo-scallop stamps or dentate impressions. Occasionally, ceramics will have been treated with a red ochre wash (Spence et al, 1990).

The Saugeen Complex is found generally in south-central Ontario and along the eastern shores of Lake Huron. The Saugeen Complex ceramics are similar in style to Point Peninsula Complex; however, the vessels tended to be cruder than their Point Peninsula counterparts. They were characterized by coil construction with thick walls, wide necks, and poorly defined shoulders. Usually, the majority of the vessel was decorated with pseudo-scallop stamps or dentate impressions, with the latter occurring more frequently at later dates (Spence et al., 1990). The Couture Complex is found in southwestern Ontario and outside of the scope of the Study Area.

Late Woodland Period

There is much debate as to whether a transitional phase between the Middle and Late Woodland periods is present in southern Ontario, but it is generally agreed that the Late Woodland period begins around 1,100 BP. The Late Woodland period in southern Ontario can be divided into three cultural sub-phases: The early, middle, and late Late Woodland periods. The early Late Woodland is characterized by the Glen Meyer and Pickering cultures and the middle Late Woodland is characterized by the Uren and Middleport cultures. These groups are ancestral to the Iroquoian-speaking Neutral-Erie (Neutral), the Huron-Wendat (Huron), and Petun Nations that inhabited southern Ontario during the late Late Woodland period (Smith, 1990, p. 285).

The Pickering and Glen Meyer cultures co-existed within southern Ontario during the early Late Woodland period (ca. 1250-700 BP). Pickering territory is understood to encompass the area north of Lake Ontario to Georgian Bay and Lake Nipissing (Williamson, 1990). Glen Meyer is centred around Oxford and Norfolk counties, but also includes the southeastern Huron basin and the western extent is demarcated by the Ekfrid Clay Plain southwest of London, Ontario (Noble, 1975). Villages of either tradition were generally smaller in size (~1 ha) and composed of smaller oval structures, which were later replaced by larger structures later in the Late Woodland period. Archaeological evidence suggested a mixed economy where hunting and gathering played an important role, but small-scale horticulture was present, indicating a gradual shift from hunting-gathering to a horticultural economy (Williamson, 1990).

The first half of the middle Late Woodland period is represented by the Uren culture (700-650 BP) and the second half by the Middleport (650-600 BP). Uren and Middleport sites of the middle Late Woodland share a similar distribution pattern across much of southwestern and south-central Ontario. (Dodd et al., 1990). Significant changes in material culture and settlement-subsistence patterns are noted during this short time. Iroquois Linear,

Ontario Horizontal, and Ontario Oblique pottery types are the most well-represented ceramic assemblages of the middle Late Woodland period (Dodd et al., 1990). At Middleport sites, material culture changes included an increase in the manufacture and use of clay pipes as well as bone tools and adornments (Dodd et al., 1990; Ferris & Spence, 1995).

During this period, evidence in the archaeological record of small year-round villages, secondary ossuary burials, and what are thought to be semi-subterranean sweat lodges suggest a marked increase in sedentism in southern Ontario during the Uren and Middleport cultures (Ferris & Spence, 1995). The increasing permanency of settlements was a result of the development of small-scale cultivation and a subsequent increased reliance on staple crops such as maize, beans, and squash (Dodd et al., 1990; Warrick, 2000; Ferris & Spence, 1995).

Archaeological evidence from the middle Late Woodland sites also documents increases in population size, community organization and village fissioning, and the expansion of trade networks. The development of trade networks with northern Algonquian peoples has also been inferred from findings at Middleport sites along the northern parts of southwestern and south-central Ontario. These changes resulted in the more organized and complex social structures observed in the late Late Woodland period.

During the late Late Woodland period, village size significantly increased as did the complexity of community and political systems. The settlement patterns of the period can be categorized into three types: large village sites, smaller hamlets or cabin sites, and special resource extraction sites. The larger villages and smaller hamlets are typically on small creeks with sandy soils suitable for agriculture. Both larger village and small hamlet sites were both typically surrounded by palisades and activities were focused on subsistence (Lennox & Fitzgerald, 1990). Larger longhouses oriented differently than others in the village have been associated with primary familial groups, while longhouses that were located outside of palisade walls may have been for visiting groups for the purposes of trade or social gatherings (Ramsden, 1990). The cabin sites were occupied on a more seasonal basis and typically only had one or two longhouses. By this time, large-scale agriculture had taken hold, making year-round villages even more practical with the improved ability to store large crop yields over winter.

The villages in the vicinity of the Study Area were typically associated with the Huron-Wendat nations who occupied areas as far east as the Trent River and as far west as the Niagara Escarpment. They typically inhabited each village for several decades until the agricultural land was exhausted and communities moved to more fertile areas. Throughout the fifteenth and sixteenth century, community movement often included northern migrations and the incorporation of multiple smaller villages into larger coalescent villages.

The Huron-Wendat eventually dispersed from the Toronto area in the 17th century, during the period of French contact, to settle in their historic homeland of Wendake, which included territory in present-day Simcoe and Grey Counties. Today, “Wendake” is the name of the Huron-Wendat reserve located in Quebec, Ontario, which was formerly known as the village of Huronia. This coalescence and subsequent movement northward was thought to be the result of a number of socio-political factors, including increased conflict with the Five Nations Iroquois, an increased complexity in political organization, stronger trade relations with northern Algonquian groups, and interactions with early European traders (Ramsden, 1990; Birch, 2012; Ferris & Spence, 1995).

Oral histories of the Michi Saagiig (Mississauga Anishinaabeg) reflect increasing levels of inter-community relationships, integration, and trade between different groups. For example, these oral histories speak to the arrival of, and relationships with, the Huron “corn growers” (Migizi & Kapyrka, 2015). In addition to archaeological interpretations, oral histories also provide a valuable contribution to our understanding of the occupation and movement of Indigenous peoples in Ontario. The following oral history, provided by Michi Saagiig elder Gitiga

Migizi, speaks to the occupation of this area of southern Ontario by the Anishinaabeg throughout the pre-contact and post-contact periods:

- The traditional homelands of the Michi Saagiig (Mississauga Anishinaabeg) encompass a vast area of what is now known as southern Ontario. The Michi Saagiig occupied and fished the north shore of Lake Ontario where the various tributaries emptied into the lake. Their territories extended north into and beyond the Kawarthas as winter hunting grounds on which they would break off into smaller social groups for the season, hunting and trapping on these lands, then returning to the lakeshore in spring for the summer months.
- The Michi Saagiig were a highly mobile people, travelling vast distances to procure subsistence for their people. They were also known as the “Peacekeepers” among Indigenous nations. The Michi Saagiig homelands were located directly between two very powerful Confederacies: The Three Fires Confederacy to the north and the Haudenosaunee Confederacy to the south. The Michi Saagiig were the negotiators, the messengers, the diplomats, and they successfully mediated peace throughout this area of Ontario for countless generations.
- Michi Saagiig oral histories speak to their people being in this area of Ontario for thousands of years. These stories recount the “Old Ones” who spoke an ancient Algonquian dialect. The histories explain that the current Ojibwa phonology is the 5th transformation of this language, demonstrating a linguistic connection that spans back into deep time. The Michi Saagiig of today are the descendants of the ancient peoples who lived in Ontario during the Archaic and Paleo periods. They are the original inhabitants of southern Ontario, and they are still here today.
- The traditional territories of the Michi Saagiig span from Gananoque in the east, all along the north shore of Lake Ontario, west to the north shore of Lake Erie at Long Point. The territory spreads as far north as the tributaries that flow into these lakes, from Bancroft and north of the Haliburton highlands. This also includes all the tributaries that flow from the height of land north of Toronto like the Oak Ridges Moraine, and all of the rivers that flow into Lake Ontario (the Rideau, the Salmon, the Ganaraska, the Moira, the Trent, the Don, the Rouge, the Etobicoke, the Humber, and the Credit, as well as Wilmot and 16 Mile Creeks) through Burlington Bay and the Niagara region including the Welland and Niagara Rivers, and beyond. The western side of the Michi Saagiig Nation was located around the Grand River which was used as a portage route as the Niagara portage was too dangerous. The Michi Saagiig would portage from present-day Burlington to the Grand River and travel south to the open water on Lake Erie.
- Michi Saagiig oral histories also speak to the occurrence of people coming into their territories sometime between 500-1000 A.D. seeking to establish villages and a corn growing economy – these newcomers included peoples that would later be known as the Huron-Wendat, Neutral, Petun/Tobacco Nations. The Michi Saagiig made Treaties with these newcomers and granted them permission to stay with the understanding that they were visitors in these lands. Wampum was made to record these contracts, ceremonies would have bound each nation to their respective responsibilities within the political relationship, and these contracts would have been renewed annually (see Gitiga Migizi and Kapyrka, 2015). These visitors were extremely successful as their corn economy grew as well as their populations. However, it was understood by all nations involved that this area of Ontario were the homeland territories of the Michi Saagiig.
- The Odawa Nation worked with the Michi Saagiig to meet with the Huron-Wendat, the Petun, and Neutral Nations to continue the amicable political and economic relationship that existed – a symbiotic relationship that was mainly policed and enforced by the Odawa people.

- Problems arose for the Michi Saagiig in the 1600s when the European way of life was introduced into southern Ontario. Also, around the same time, the Haudenosaunee were given firearms by the colonial governments in New York and Albany which ultimately made an expansion possible for them into Michi Saagiig territories. There began skirmishes with the various nations living in Ontario at the time. The Haudenosaunee engaged in fighting with the Huron-Wendat and between that and the onslaught of European diseases, the Iroquoian speaking peoples in Ontario were decimated.
- The onset of colonial settlement and missionary involvement severely disrupted the original relationships between these Indigenous nations. Disease and warfare had a devastating impact upon the Indigenous peoples of Ontario, especially the large sedentary villages, which mostly included Iroquoian speaking peoples. The Michi Saagiig were largely able to avoid the devastation caused by these processes by retreating to their wintering grounds to the north, essentially waiting for the smoke to clear.
- Often times, southern Ontario is described as being “vacant” after the dispersal of the Huron-Wendat peoples in 1649 (who fled east to Quebec and south to the United States). This is misleading as these territories remained the homelands of the Michi Saagiig Nation.
- The Michi Saagiig participated in eighteen treaties from 1781 to 1923 to allow the growing number of European settlers to establish in Ontario. Pressures from increased settlement forced the Michi Saagiig to slowly move into small family groups around the present-day communities: Curve Lake First Nation, Hiawatha First Nation, Alderville First Nation, Scugog Island First Nation, New Credit First Nation, and Mississauga First Nation. The Michi Saagiig have been in Ontario for thousands of years, and they remain here to this day.

Migizi and Kapyrka pp. 127-136 (2015)

Early contact with European settlers at the end of the Late Woodland period resulted in extensive changes to the traditional lifestyles of most populations inhabiting Ontario including settlement size, population distribution, and material culture. The introduction of European-borne diseases significantly increased mortality rates, resulting in a drastic drop in population size (Warrick, 2000).

4.1.2 Post-Contact Period

Early European presence within the Study Area began as early as 1615 with the travels of the French explorer Etienne Brulé who travelled with the Huron along the major portage route known as the Toronto Carrying Place Trail, also known as the Humber Portage, which connected Lake Ontario with Lake Simcoe and the northern Great Lakes (Steckley, 1987; Ramsden, 1990). From Lake Ontario, the trail ran northward along the eastern branch of the Humber River.

In 1615-1616, Samuel De Champlain also travelled with the Huron northward to Georgian Bay. By the 1640s, the Huron, Petun, Neutral, and Mississauga Anishinaabeg had dispersed out of this region of southern Ontario as a result of the warfare and disease that had arrived with European colonization. The large-scale population dispersals gave way for the Haudenosaunee to occupy the territory along the north shore of Lake Ontario where they settled along inland-running trade routes. These settlements included the villages of Ganatsekwyagon on the Rouge River and Teiaiagon on the Humber River at the head of the Toronto Carrying Place Trail (Steckley, 1987; Ramsden, 1990). Due to increased military pressure from the French in the late 1600s, and the return of the Anishinaabe Nations (Ojibwa, Odawa, Potawatomi, and Mississauga) who had previously retreated to the north, the Haudenosaunee abandoned their villages along the north shore of Lake Ontario.

TREATY NO. 13A, 1805/HEAD OF THE LAKE PURCHASE

The Study Area is situated within the boundaries of Treaty No. 13A, also known as the 1805/Head of the Lake Purchase. This treaty was signed after the Toronto Purchase, Treaty No. 13, on September 6, 1805, between the Crown and the Mississaugas (Shanahan, 2021). Before this signing, the Crown had obtained nearly all of the north shore of Lake Ontario all the way to Niagara, less the area of approximately 35 miles at the head of the Lake between Niagara and York. In August 1805, the Mississaugas stated their conditions for ceding this area of land which included keeping three areas of land for themselves: Twelve Mile Creek, Sixteen Mile Creek, and at the mouth of the Credit River. They wished to keep the entire waterfront along the stretch of the land parcel, as they had been forced off of the waterfront in other treaties. A compromise was struck where the Mississaugas were promised the use of the waterfront, and another area of the parcel would be reimbursed back to the Tuscaroras after they acquired the land from the Crown in a previous deal. Eventually the treaty was drawn up and officially covered part of the Mississauga Tract beginning on the east at the Etobicoke River and extending westward to a parcel of land previously granted to Joseph Brant. A few areas were retained for the Mississaugas including a reserve on the Credit River and fishing stations at 16 Mile Creek and 12 Mile Creek. With the completion of this treaty, the Crown finally gained control over the continuous waterfront along Lake Ontario.

Toronto Township

In 1805, another land purchase was conducted by the British government and the newly acquired land was divided into three townships: Nelson Township, Trafalgar Township and Toronto Township (Riendeau, 1985). The Toronto Township surveys were completed in 1805, and settlement began soon after. Much of the land was used for farming and many small hamlets began to form throughout the township (Mississauga Heritage, 2012).

The original survey of Toronto Township, completed in 1805, was laid out with two concessions north of Base Line (now Eglinton Avenue) and three concessions south to the lakefront, excluding the reserve lands encompassing the Credit River (Riendeau, 1985). Settlement in the township concentrated along Dundas Road and by the 1830s three distinct villages had developed: Summerville, Dixie, Cooksville and Erindale (Riendeau, 1985). Communities along the Lakeshore Road were much slower to develop than those along Dundas, and by the end of the 1830s several communities to the west of the Credit River began to take shape.

In the latter half of the nineteenth century, the population of Toronto Township began to decline due to the urbanization of larger communities in proximity to the township such as Toronto, Hamilton and Brampton. These larger communities drew people off their farms into the more lucrative factory work and this change in lifestyle marked a change in how small communities would develop in the township. The villages started to develop urban sprawl (neighbourhoods), rather than developing into small towns, that were surrounded by lands used for commercial agriculture which branched out from the wheat industry into livestock and orchards.

At the end of the First World War the boundaries of the City of Toronto began to expand towards Toronto Township and the population of the township boomed. The continued urbanization focused on subdivisions spreading from the eastern edge of the township absorbing communities in its wake (Riendeau, 1985).

Port Credit

In 1834, Old Port Credit Village was surveyed, and settlers began building cottages in the area. By 1844, the population had reached 150, and the village had expanded to include a Methodist church, blacksmith shop, schoolhouse, post office, and other small businesses. Timber from the area was used for shipbuilding, and salmon fishing was prosperous until pollution from the mills affected the Credit River by the late 1840s. The area soon became a busy shipping center and the population reached 400 by the mid-1850s. The introduction of the

Great Western Railway (GWR) to the area aided communication and travel from Port Credit to both Toronto and Hamilton, however, it also diverted a portion of the shipping activity away from the harbour (Riendeau, 1985). The Port Credit rail station was opened in December 1855, near Stavebank Road. (Clarkson, 1967). In 1855, the harbour suffered from a fire, causing the shipping activity to be further affected. By the mid-1860s, the population decreased to 350. Stonehooking became a prosperous business in the Port Credit area and consisted of large schooners that would collect stones from the bottom of Lake Ontario, to be sold as building materials to Toronto and the other surrounding settlements. Port Credit also became a destination for fishing, and soon cottages and shopping areas were constructed for summer residents. By 1900, the population had increased to 650, making Port Credit the largest village in Toronto Township (Riendeau, 1985). In 1905, a new iron railway bridge was built over the Credit, replacing the wooden trestle bridge, and the train station was moved from its location at Stavebank Road to its current location (Clarkson, 1967).

In 1909, Port Credit became a Police Village as its population had reached 750 residents. By 1914, Port Credit incorporated as a Village. The Lakeshore Highway was opened in 1915, which allowed American tourists to easily visit the area, and the Queen Elizabeth Way (QEW) was completed in 1939, facilitating rapid population expansion. Port Credit transitioned into a commuter village, with many of its residents working in Toronto. The population reached 2000 by 1946 and by 1961 Port Credit acquired Town status after its population had increased to over 6500 (Clarkson, 1967).

The Toronto Township area developed further and the small villages in the area became more established. In 1968, the Town of Mississauga was created. In 1974, the Town of Mississauga amalgamated with the towns of Port Credit and Streetsville, and with parts of the townships of Toronto Gore and Trafalgar, to become the City of Mississauga (Mississauga Heritage, 2012).

4.1.3 HISTORICAL MAPPING REVIEW

A review of historical mapping and aerial photography was undertaken to understand the changing landscape and built environment within the Study Area. To determine the presence of historical features, nineteenth century historical county maps, twentieth century topographic maps, and aerial photos were reviewed. While these maps and photographs were not the only visual sources consulted for the purposes of this study, they were determined to provide the best overview of land development in the Study Area. The maps and aerial photos consulted include: the 1877 Illustrated Historical Atlas for the County of Peel, the 1909 Topographic Map from the Department of Militia and Defence, the 1922 Topographic Map from the Department of National Defence, the 1931 Topographic Map from the Department of Militia and Defence, the 1954 Aerial, the 1974 Topographic Map from the Department of Energy, Mines and Resources, and the 1994 Topographic Map from the Department of Energy, Mines and Resources.

The 1877 Illustrated Historical Atlas for the County of Peel (Figure 2) shows the late nineteenth century Lake Ontario shoreline to be relatively consistent with the shoreline of today. The Port Credit Village is visible along the mouth of the Credit River where it meets Lake Ontario. The Grand Trunk Railway line that connects to Toronto is identified crossing the Credit River. Larger lots of varied length and width are recorded to the east Port Credit Village with building footprints and ownership information marked.

The 1909 Topographic Map from the Department of Militia and Defence (Figure 3) shows the same concentrated settlement pattern as the 1877 historic map. Immediately east and north of Port Credit Village there are hardly any building footprints. The 1922 Topographic Map from the Department of National Defence (Figure 4)

demonstrates a similar concentrated settlement in the Port Credit Village area and further development immediately east on the north side of Lakeshore Road East

The 1931 Topographic Map from the Department of Militia and Defence (Figure 5) shows a further increase in residential development in the Port Credit Village vicinity to the east, and on the south side of Lakeshore Road East. The 1954 Aerial (Figure 6) shows the limits of Port Credit Village and that it has expanded greatly. Further residential development in the Mineola neighbourhood is visible immediately north of the railway. The railway has changed ownership to the Canadian National Railway.

The 1974 Topographic Map from the Department of Energy, Mines and Resources (Figure 7) demonstrates similar development patterns as the 1954 Aerial, with the addition of the Port Credit Marina. The 1994 Topographic Map from the Department of Energy, Mines and Resources (Figure 8) shows the increasing suburban development of the surrounding area, which continues through the 2000s based on additional aerial photography.

5.0 EXISTING CONDITIONS

5.1 Site Visit

A field visit was conducted on March 15, 2023 by Claire Forward, Cultural Heritage Specialist, to record the existing conditions of the project Study Area. The field review was preceded by a review of available historical and current aerial photographs and maps. These photographs and maps were reviewed for any potential BHRs and CHLs that may be extant in the Study Area. The existing conditions of the Study Area are described below.

5.2 Description of Existing Conditions

The majority of the Study Area consists of residential subdivisions and a commercial area. The type of roadway throughout the Study Area is asphalt. As visible from the roads in the Study Area, the representative resources include houses and commercial buildings. The Study Area consists of parts of Stavebank Road, Rosemere Road, Mona Road, Sandham Road, Vesta Drive, Lakeshore Road East, Hiawatha Parkway, Wanita Road, Cumberland Drive, Rosewood Avenue, Elmwood Avenue North, Elmwood Avenue South, Carlis Place, St. Lawrence Drive, and Front Street North.

5.2.1 Stavebank Road

Stavebank Road travels north-south at the northern boundary of the Study Area. The road begins at the Queensway West in the north and terminates at the Port Credit Harbour Marina in the south. The road surface is asphalt and contains one lane of traffic in both directions and partial gravel shoulders in some areas. Within the Study Area the lands on either side of Stavebank Road consist of individual dwellings (Image 1 – Image 4).

Image 1: View of Stavebank Road looking north towards the intersection with Mineola Road West.

Image 2: View of typical dwellings on Stavebank Road.

Image 3: View of Stavebank Road looking south towards the railway crossing.

Image 4: View of Stavebank Road looking east at the intersection with Rosemere Road.

5.2.2 Rosemere Road

Rosemere Road travels east-west at the intersection with Stavebank Road. The road begins and ends at Stavebank. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on the north side of Rosemere Road consist of individual dwellings. The lands on the south side of Rosemere Road contain the Rosemere SPS (Image 5 – Image 6).

Image 5: View of Rosemere Road looking west towards the intersection with Stavebank Road.

Image 6: View of typical dwellings on Rosemere Road.

5.2.3 Mona Road

Mona Road travels north-south at the intersection with Sandham Road. The road begins at Veronica Drive in the north and ends at Sandham Road in the south. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Mona Road consist of individual dwellings (Image 7 – Image 8).

Image 7: View of Mona Road looking north from the intersection with Sandham Road.

Image 8: View of typical dwelling on Mona Road.

5.2.4 Sandham Road

Sandham Road travels east-west between Mona Road and Vesta Drive. The road begins at Mona Road in the east and Vesta Drive in the west. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Mona Road consist of no dwellings and a series of trees that act as a barrier between Sandham Road and the railway (Image 9 – Image 10).

Image 9: View of Sandham Road looking west towards the intersection with Mona Road.

Image 10: View of Sandham Road looking east towards the intersection with Vesta Drive.

5.2.5 Vesta Drive

Vesta Drive travels north-south at the intersection with Sandham Road. The road begins at Veronica Drive in the north and ends at Sandham Road in the south. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Vesta Drive consist of individual dwellings (Image 11 – Image 12).

Image 11: View of Bath Road looking south towards the intersection with Sandham Road.

Image 12: View of typical dwelling on Vesta Drive.

5.2.6 Lakeshore Road East

Lakeshore Road East travels east-west in the middle of the overall Study Area. The road begins at Lake Shore Boulevard West in Etobicoke in the east and ends at Lakeshore Road West in Port Credit in the west. The road surface is asphalt and contains two lanes of traffic in both directions with sidewalks on either shoulder. The road is lined with one to three-storey commercial and residential buildings. The Port Credit Lighthouse is located at the intersection of Front Street North and Lakeshore Road East (Image 13 – Image 16).

Image 13: View of Lakeshore Road East looking east at the Hiawatha Parkway intersection.

Image 14: View of Lakeshore Road East looking west at the Hiawatha Parkway intersection.

Image 15: View of Lakeshore Road East looking north towards the intersection with Stavebank Road.

Image 16: View of Lakeshore Road East looking south towards the Port Credit Lighthouse at the intersection with Front Street North and Lakeshore Road West.

5.2.7 Hiawatha Parkway

Hiawatha Parkway travels north-south at the intersection with Wanita Road. The road begins at Lakeshore Road East in the north and ends at Cumberland Drive in the south. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Hiawatha Parkway consist of individual dwellings (Image 17 – Image 20).

Image 17: View of Hiawatha Parkway looking north at the intersection with Wanita Road.

Image 18: View of Hiawatha Parkway looking south at the intersection with Wanita Road.

Image 19: View of Hiawatha Parkway looking south at the intersection with Cumberland Drive.

Image 20: View of Hiawatha Parkway looking north at the intersection with Cumberland Drive.

5.2.8 Wanita Road

Wanita Road travels east-west at the intersection with Hiawatha Parkway. The road begins immediately south of St. James Catholic School in the east and ends at Elmwood Avenue South in the west. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Wanita Road consist of individual dwellings (Image 21 – Image 24).

Image 21: View of Wanita Road looking east at the intersection with Hiawatha Parkway.

Image 22: View of Wanita Road looking west at the intersection with Hiawatha Parkway.

Image 23: View of Wanita Road looking east at the intersection with Elmwood Avenue South.

Image 24: View of typical dwelling on Wanita Road.

5.2.9 Cumberland Drive

Cumberland Drive travels north-south at the intersection with Lakeshore Road East and east-west opposite Lake Ontario. The road begins at Lakeshore Road East in the north and ends at the waterfront trail next to the Adamson Estate in the east. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on both sides of Cumberland Drive consist of individual dwellings (Image 25 – Image 26).

Image 25: View of Cumberland Drive look east at the intersection with Hiawatha Parkway.

Image 26: View of a typical dwelling on Cumberland Drive.

5.2.10 Rosewood Avenue

Rosewood Avenue travels north-south at the intersection with Lakeshore Road East. The road begins at Queen Street East in the north and ends at ends at Lakeshore Road East in the south. The road surface is asphalt and contains one lane of traffic in both directions with sidewalks on either shoulder. The lands on both sides of Rosewood Avenue consist of individual dwellings, a park, and several commercial buildings (Image 27 – Image 28).

Image 27: View of Rosewood Avenue looking north at the intersection with Lakeshore Road East.

Image 28: View of a typical dwelling on Rosewood Avenue.

5.2.11 Elmwood Avenue North

Elmwood Avenue North travels north-south at the intersection with Lakeshore Road East. The road begins at Queen Street East in the north and ends at ends at Lakeshore Road East in the south. The road surface is asphalt and contains one lane of traffic in both directions with a single sidewalk on the western shoulder. The lands on both sides of Elmwood Avenue North consist of individual dwellings and commercial buildings (Image 29 – Image 30).

Image 29: View of Elmwood Avenue North looking south from the intersection with Forest Avenue.

Image 30: View of a typical dwelling on Elmwood Avenue North.

5.2.12 Elmwood Avenue South

Elmwood Avenue South travels north-south at the intersection with Lakeshore Road East. The road begins at Lakeshore Road East in the north and ends at Carlis Place in the south. The road surface is asphalt and contains one lane of traffic in both directions. The lands on the east side of Elmwood Avenue South consist of individual dwellings. The lands on the west side of Elmwood Avenue South consist of a large hedge that separates the street from the neighbouring townhouse development on St. Lawrence Drive (Image 31 – Image 32).

Image 31: View of Elmwood Avenue South looking south towards the intersection with Wanita Road.

Image 32: View of Elmwood Avenue South looking north at the intersection with Wanita Road.

5.2.13 Carlis Place

Carlis Place travels east in a circle at the intersection with Elmwood Avenue South. The road begins and ends at Elmwood Avenue South. The road surface is asphalt and contains one lane of traffic in both directions with no shoulders. The lands on Carlis Place consist of individual dwellings (Image 33 – Image 34).

Image 33: View of Carlis Place looking east at the intersection with Elmwood Avenue South.

Image 34: View of a typical dwelling on Carlis Place.

5.2.14 St. Lawrence Drive

St. Lawrence Drive travels north-south at the intersection with Lakeshore Road East. The road begins and ends at Lakeshore Road East. The road surface is asphalt and contains one lane of traffic in both directions with sidewalks on either shoulder. The lands on both sies of St. Lawrence Drive consist of modern townhouses and the Tall Oaks Park immediately south (Image 35 – Image 38).

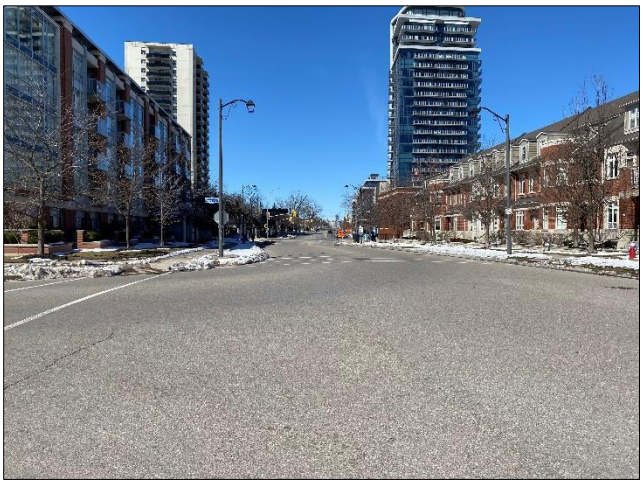

Image 35: View of St. Lawrence Drive looking north towards the intersection with Lakeshore Road East.

Image 36: View of a typical dwelling on St. Lawrence Drive.

Image 37: View of St. Lawrence Drive from the waterfront trail in Tall Oaks Park, looking north east.

Image 38: View immediately south of St. Lawrence Drive in Tall Oaks Park on the waterfront trail, looking east towards Carlis Place.

5.2.15 Front Street North

Front Street North travels north-south at the intersection with Lakeshore Road East. The road begins at Mississauga Road in the north and ends at Lakeshore Road East in the south. The road surface is asphalt and contains one lane of traffic in both directions with sidewalks on either shoulder. The lands on the east side of Front Street North contain a park and the Don Rowing Club of Mississauga. The lands on the west side of Front Street North contain both dwellings and commercial and public buildings (Image 39 to Image 42).

Image 39: View of Front Street North looking south at the intersection with High Street West.

Image 40: View Front Street North looking north after the intersection with Lakeshore Road East.

Image 41: View of the Lakeshore Road East and Front Street North intersection from the bridge looking west.

Image 42: View of a typical dwelling on Front Street North.

5.3 Previous Cultural Heritage Assessments

There have been several cultural heritage assessments whose Study Area overlaps or is located nearby the current Study Area:

- Cultural Heritage Screening Report: Port Credit Wastewater Servicing Optimization Class Environmental Assessment (Golder, 2020)
- Heritage Impact Assessment: 10 Mississauga Road North Heritage Impact Assessment (Heritage Resources Consulting, 2020)
- Cultural Heritage Resource Assessment: Front Street Wastewater Diversion Project (WSP, 2019)
- Heritage Impact Assessment and Cultural Landscape Heritage Impact Assessment: 70 Mississauga Road South and 181 Lakeshore Road West (ERA, 2018)

All extant cultural heritage resources identified in these studies that fall within the current Study Area have been identified in Table 5-1: Identified BHRs and CHLs with Known or Potential CHVI.

5.4 Identified Cultural Heritage Resources

A desktop study and a field visit were completed to identify known and potential BHRs and CHLs older than 40 years of age located within or adjacent to the Study Area as described in Section 3. A review was conducted to determine previously identified heritage resources documented within or adjacent to the Study Area, including listed (registered non-designated) and designated properties, heritage conservation districts and known CHLs. This included a review of the City of Mississauga's Heritage Register (2023). Two (2) CHLs, one (1) HCD, and eight (8) BHRs were identified in the Study Area.

During the field review, the Study Area was examined for potential heritage resources by employing a high-level and cursory evaluation based on an understanding of the criteria identified in the MCM's *Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes*. As a result of this review, one (1) CHL and seventeen (17) BHRs were identified in the Study Area.

See Table 5-1 on the following page for a description of the heritage resources, and Figure 9 and 10 in Appendix A for an illustration of their locations within the Study Area.

Table 5-1: Identified BHRs and CHLs with Known or Potential CHVI

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
CHL 1	Residential Neighbourhood	Hurontario Street to the northeast, the railway tracks and Port Credit Go Station to the southeast, the Credit River to the southwest, and the Q.E.W. to the northwest.	Listed as a Cultural Heritage Landscape on City of Mississauga's Inventory of Cultural Heritage Landscapes	The Mineola Neighbourhood Residential Landscape, as noted in the Cultural Landscape Inventory was developed before it became standard practice to regrade top soil into large piles in the early twentieth century. A road system was imposed on the natural rolling topography of the Iroquois Plain and homes were constructed in slightly larger lots where natural drainage areas were retained. This provided greater opportunity to save existing trees and because the soils and drainage system were minimally impacted, provided fertile ground for the planting of new vegetation, the natural regeneration of native trees and landscaping of the residential landscapes. Its cultural heritage attributes include: ▪ Mature tree canopy and natural landscaping throughout the Mineola Neighbourhood ▪ Existing roadway locations and widths ▪ Undulating topography ▪ The street patterns with rural cross-section ▪ Setbacks of existing residential buildings throughout the neighbourhood ▪ Built form associated with development prior to 1960 ▪ Stone walls and fencing throughout the neighbourhood	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
CHL 2	Natural Area - River	Credit River from Port Credit to the north boundary of Mississauga	Listed as a Cultural Heritage Landscape on City of Mississauga's Inventory of Cultural Heritage Landscapes	This landscape is a core of greenspace through Mississauga, its topography varies from wide floodplains to sharply sloping valley walls. According to the Cultural Landscape Inventory, the Credit River is the most significant natural landscape and wildlife habitat in the city. The Government Inn 1798-1861 plaque is located within the CHL. During a pre-PIC meeting, the City of Mississauga informed GM BluePlan that the plaque has since been removed for temporary storage due to the Front Street Pumping Station and Wastewater Diversion. Its cultural heritage attributes include: ▪ The steep valley walls, benches, and alluvial terraces of the Credit River Valley; ▪ The meandering river and meander belt; ▪ The scenic quality of the natural environment, including the river and vegetation of the Valley; ▪ Existing city and community parks; ▪ Feature sites, identified in the Credit River Parks Strategy: ▪ Bridging points: Queen Elizabeth Way Bridge over Credit River, Canadian National Bridge over Credit River; ▪ Existing trail systems; ▪ Public access to the river; ▪ Known and potential archaeological sites and ruins; ▪ Port Credit Pier; ▪ Wetlands; ▪ Geological formations, in particular north and south of Dundas Street along the Credit ▪ River; ▪ Port Credit Lighthouse; and ▪ Identified viewpoints, identified overlooks, and potential overlooks	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
CHL 3	Transportation - Railway	Railway crosses through the northern portion of the Study Area and through Mississauga.	Potential Cultural Heritage Value or Interest (CHVI) identified during field review.	Former Hamilton and Toronto Railway Line that opened in 1856. The railway is visible on Tremaine's 1859 Map of the County of Peel, Canada West and continues to function as a railway with GO and VIA trains currently occupying the track.	
HCD 1	Village Settlement	The natural boundary of the Credit River defines the eastern limit, the southern boundary of Lake Ontario, the western boundary of Mississauga Road defines the western edge, and the northern boundary of Lakeshore Road West.	Designated as a Heritage Conservation District under Part V of the OHA (By-law 0272-2004)	The current HCD plan was approved by the Ontario Municipal Board in 2004 and was amended in 2018. Due to extensive redevelopment north of Lakeshore Road West, the District contains almost all of the features associated with old Port Credit village. The Old Port Credit Village HCD's heritage attributes include: ▪ Property boundaries conform to the government's planned village survey dated 1835; ▪ Human use and activity predate the government's village survey by many thousands of years; ▪ Urban form is defined by the original grid of streets, by the Credit River and by J.C. Saddington Park; ▪ The urban fabric is primarily comprised of a low-rise built form with modest building footprints relative to lot size; ▪ A number of institutional landmarks important to Port Credit's history remain; ▪ A number of historic buildings, built as houses and converted to commercial use or built with a public function in mind, but now used as houses remain; ▪ Other houses of historic interest are modest vernacular dwellings; ▪ Front yards consist of maintained landscaping of lawns and ornamental gardens with a variety of deciduous and coniferous specimen trees. Parking is generally provided in a single car width driveway often leading to a rear yard garage. ▪ Views of Credit River and Lake Ontario from Lakeshore Road West and from within the District; ▪ Views from Lake Ontario and the mouth of the Credit River harbour north to Lakeshore Road West, including both sides of the harbour.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 1	Dwelling	1150 Stavebank Road	Listed on the Heritage Register, but not Designated	This property contains a one-storey horizontally clad with blue siding post-war Suburban dwelling. It has a side gabled roof and a rectangular plan and was constructed in the post-war boom. The house has an symmetrical façade and consists of a centered entrance flanked by windows. It has been modified with the addition of new windows and a new front door. This property is a part of CHL 1, the Mineola Neighbourhood Residential Landscape.	
BHR 2	Dwelling	1159 Stavebank Road	Listed on the Heritage Register, but not Designated	This property contains a two-storey horizontally clad with blue siding Georgian style dwelling. It has a red mansard roof with a rectangular plan. The house has a symmetrical façade and is made up of a centered entrance flanked by windows on the ground floor and three windows centered on the first floor, with the middle window having a Juliet balcony. Topographic mapping suggests a dwelling on this property was constructed before 1922. It has been modified with the addition of new windows and a new front door. This property is a part of CHL 1, the Mineola Neighbourhood Residential Landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 3	Dwelling	1153 Mona Road	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey yellow-brick post-war Suburban dwelling with a side gabled roof, constructed in the post-war boom with a rectangular plan. The house has an asymmetrical façade and consists of a centered entrance flanked by windows of varying sizes. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape. This property is a part of CHL 1, the Mineola Neighbourhood Residential Landscape.	
BHR 4	Dwelling	1150 Vesta Drive	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey yellow-brick post-war Suburban dwelling with side gabled roof, constructed in the post-war boom with a rectangular plan. The house has a symmetrical façade and consists of a centered entrance flanked by windows of equal sizes. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape. This property is a part of CHL 1, the Mineola Neighbourhood Residential Landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 5	Dwelling	1155 Vesta Drive	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey yellow-brick post-war Suburban dwelling with low slope hipped roof, constructed in the post-war boom with a rectangular plan. It has an asymmetrical façade. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape. This property is a part of CHL 1, the Mineola Neighbourhood Residential Landscape.	
BHR 6	Dwelling	75 Cumberland Drive	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a two-storey horizontally clad with yellow siding Suburban dwelling with a hip roof, constructed in the post-war boom with a rectangular plan. It has been modified with the addition of new windows, a new front door, and garage extension. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 7	Dwelling	83 Cumberland Drive	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey stucco-clad post-war Suburban dwelling with a mansard roof, constructed in the post-war boom with a rectangular plan. It has been modified with the addition of new windows, a new front door, and new paving. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 8	Dwelling	40 Hiawatha Parkway	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one and a half storey red-brick Georgian Revival cottage dwelling, constructed during the 1930s. The house has a rectangular plan and a medium pitched gable roof, punctuated by two dormers. The house has a symmetrical façade and the entrance is flanked by two windows. It has been modified with the addition of new windows and a new front door.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 9	Dwelling	21 Hiawatha Parkway	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey red-brick post-war Suburban dwelling with a low slope hipped gable roof, constructed in the post-war boom with a rectangular plan, with an enclosed porch on the main facade. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 10	Dwelling	23 Hiawatha Parkway	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one and a half storey red-brick post-war Suburban dwelling with a high pitched gabled roof and central dormer with two windows, constructed in the post-war boom with a rectangular plan. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 11	Dwelling	24 Hiawatha Parkway	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a two-storey red-brick post-war Suburban dwelling with a side-gabled roof and central dormer, constructed in the post-war boom with a rectangular plan. Horizontal siding surrounds the window and door openings. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 12	Dwelling	25 Rosewood Avenue	Listed on the Heritage Register, but not Designated	This property includes a two-storey Edwardian dwelling with a hip roof and central dormer. It is clad in beige stucco and has a red brick chimney stack on the south façade. It was constructed between 1900 and 1930 with a rectangular plan. It has been modified with the addition of new windows and a new front door.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 13	Dwelling	17 Rosewood Avenue	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey red-brick and horizontal siding post-war Suburban dwelling with a hip roof, constructed in the post-war boom with a rectangular plan. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 14	Dwelling	11 Rosewood Avenue	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property is an example of a two-storey Edwardian dwelling with a hip roof and central dormer and is horizontally clad in white siding. It was constructed between 1900 and 1930 with a rectangular plan. It has been modified with the addition of new windows and a new front door.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 15	Dwelling	10 Rosewood Avenue	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a one-storey red-brick post-war Suburban dwelling with a side-gabled roof and central dormer, constructed in the post-war boom with a rectangular plan. Horizontal siding surrounds the window and door openings. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 16	Dwelling	7 Elmwood Avenue North	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a two-storey dwelling, now converted to a business, with a hipped roof, broad eaves, a central dormer, large windows and a red brick chimney stack on the south façade. It was constructed in between 1931 and 1954 in the Prairie style with a rectangular plan. It has been modified with the addition of new windows and a new front door.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 17	Apartment Block	181 Lakeshore Road East	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a two-storey red-brick post-war Suburban apartment building with a flat roof, constructed during the post-war boom with a rectangular plan. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 18	Apartment Block	183 Lakeshore Road East	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property also contains a four-storey red-brick post-war Suburban apartment building with a flat roof and concrete coursing, constructed during the post-war boom with a rectangular plan. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 19	Apartment Block	185 Lakeshore Road East	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property also contains a four-storey red-brick post-war Suburban apartment building with a flat roof and concrete coursing, constructed during the post-war boom with a rectangular plan. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 20	Dwelling	1 Wanita Road	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a three-storey red and yellow-brick apartment building with a low slope hipped roof, constructed in 1954 in the modern style with a rectangular plan. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 21	Dwelling	3 Carlis Place	Potential Cultural Heritage Value or Interest (CHVI) identified during field review	This property contains a three-storey yellow-brick apartment building with a low slope hipped roof, constructed between 1955 and 1966 in the modern style with a rectangular plan. It has been modified with the addition of new windows and a new front door. It is directly related to the development of the surrounding area as it changed from rural properties and farms to an urban landscape.	
BHR 22	Dwelling	10 Front Street North	Listed on Heritage Register but not Designated	The property contains a two-storey red-brick dwelling with a cross-gable roof, constructed between 1890 and 1912 in the Suburban Farmhouse style of the Gothic Revival style with a L-shaped plan. It has been modified with a front porch addition and new windows and doors. It is directly related to the origins of Port Credit Village.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 23	Recreational Sport Club	25 Front Street North	Listed on Heritage Register but not Designated	The Don Rowing Club of Mississauga is located at 25 Front Street North. Formed in 1878 by the Christie brothers, the Don Rowing Club was originally located in downtown Toronto close to Overend Street. The club moved to the town of Port Credit in 1960 and joined forces with the canoe club to construct the building that presently occupies the site. It was difficult to construct since the land beneath the building was wetlands, so pilings had to be driven 35-40 feet down into the ground to stabilize the land. The building is three storeys in height and modern in style with a rectangular plan. It is made up of a grey and white brick with modern window and door openings. The rowing club is a part of CHL 2, the Credit River Corridor.	
BHR 24	Port Credit Memorial Library	20 Lakeshore Road East	Listed on Heritage Register but not Designated	The Port Credit Memorial Library was constructed in 1962 in the modern style. The building is two stories in heights and rectangular in plan. It is made up of glass and yellow brick with modern window and door openings. During the 2010s an extension was added to the east elevation and the yellow brick was covered with black siding. The building is currently undergoing structural repairs. The library is a part of CHL 2, the Credit River Corridor.	

BHR OR CHL #	TYPE OF PROPERTY	LOCATION	HERITAGE RECOGNITION	DESCRIPTION OF KNOWN OR POTENTIAL CHVI	PHOTOGRAPHS
BHR 25	Port Credit Memorial Park	22 Stavebank Road	Listed on Heritage Register but not Designated	The park consists of various walkways, a large pavilion, open lawn and plaza space usually used for events and festivals. There is also a picnic area, skate park, and playground. The park is a part of CHL 2, the Credit River Corridor.	

6.0 PRELIMINARY IMPACT ASSESSMENT

To establish potential impacts, identified BHRs and CHLs were considered against a range of possible impacts as outlined in the MCM's *Information Bulletin 3: Heritage Impact Assessments for Provincial Heritage Properties* (2017) (see Section 1.2 for a full description of impacts).

Where any BHRs and CHLs may experience direct or indirect impacts, appropriate mitigation measures will be developed. If appropriate, this may require the completion of a CHER to identify the property's CHVI and heritage attributes if the property's heritage attributes have yet to be defined. For properties that have been subject to a CHER or their CHVI has otherwise been defined, an HIA may be required to determine appropriate mitigation measures.

6.1 Preliminary Impacts on Cultural Heritage Resources

This section provides a preliminary assessment of the potential adverse affects that may result from the Project's preferred alternatives. The conservation of BHRs and CHLs in planning is considered to be a matter of public interest. Changes to transit infrastructure have the potential to adversely affect BHRs and CHLs by displacement and/or disruption during and after construction. These heritage resources may experience displacement (i.e., removal) if they are located within the footprint of the undertaking. There may also be potential for disruption or indirect impacts to BHRs and CHLs by the introduction of physical, visual, audible or atmospheric elements that are not in keeping with their character and/or setting.

Methods of minimizing or avoiding a negative impact on a BHR or CHL include, but are not limited to:

- Alternative development approaches;
- Isolating development and site alteration from significant built and natural features and vistas;
- Design guidelines that harmonize mass, setback, setting and materials;
- Limiting height and density;
- Allowing only compatible infill and additions;
- Reversible alterations;
- Buffer zones, site plan control and other planning mechanisms;
- Recommendations for additional studies, including CHERs, HIAs and Strategic Conservation Plans; and,
- Alterations to project design during construction planning and project controls (i.e., vibration reduction, dust suppression or other measures).

Table 6-1 considers the potential impacts of the preferred alternatives on known or potential BHRs and CHLs. The Study Area for the Port Credit East Water and Wastewater Servicing Optimization Strategy was reviewed to assess impacts to identified heritage resources (Figure 9 and 10 in Appendix A).

Table 6-1: Impacts and Preliminary Mitigation Strategies for BHRs and CHLs

RESOURCE	ADDRESS/LOCATION	DISCUSSION OF IMPACT	MITIGATION STRATEGIES
CHL 1	Hurontario Street to the northeast, the railway tracks and Port Credit Go Station to the southeast, the Credit River to the southwest, and the Q.E.W. to the northwest.	**Direct Impact** **Rationale:** Construction works will be carried out within the boundaries of the CHL.	A Heritage Impact Assessment should be undertaken to recommend whether mitigative measures are required to conserve the significant attributes of the CHL.
CHL 2	Credit River from Port Credit to the north boundary of Mississauga	**Direct Impact** **Rationale:** Construction works will be carried out within the boundaries of the CHL.	A Heritage Impact Assessment should be undertaken to recommend whether mitigative measures are required to conserve the significant attributes of the CHL.
CHL 3	Railway crosses through the northern portion of the Study Area and through Mississauga.	**No Impact** **Rationale:** The works will not extend to CHL 3, no impacts are anticipated for CHL 3.	None required.
HCD 1	The natural boundary of the Credit River defines the eastern limit, the southern boundary of Lake Ontario, the western boundary of Mississauga Road defines the western edge, and the northern boundary of Lakeshore Road West.	**Potential Impact** **Rationale:** Construction works will be carried out immediately adjacent to the HCD.	A Heritage Impact Assessment should be undertaken to recommend whether mitigative measures are required to conserve the significant attributes of the HCD.
BHR 1	1150 Stavebank Road	**No Impact** **Rationale:** The works will not extend to BHR 1 at 1150 Stavebank Road, no impacts are anticipated for BHR 1.	None required.
BHR 2	1159 Stavebank Road	**No Impact** **Rationale:** The works will not extend to BHR 2 at 1159 Stavebank Road, no impacts are anticipated for BHR 2.	None required.
BHR 3	1153 Mona Road	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. Road occupancy for construction will be located adjacent to the property, as such unforeseen vibration	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.

RESOURCE	ADDRESS/LOCATION	DISCUSSION OF IMPACT	MITIGATION STRATEGIES
		impacts could result from construction activities.	
BHR 4	1150 Vesta Drive	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. Road occupancy for construction will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 5	1155 Vesta Drive	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. Road occupancy for construction will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 6	75 Cumberland Drive	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. Construction works will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 7	83 Cumberland Drive	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. Construction works will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 8	40 Hiawatha Parkway	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts..

BHR 21	3 Carlis Place	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. CTE for construction, new infrastructure, and a proposed shaft will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.

RESOURCE	ADDRESS/LOCATION	DISCUSSION OF IMPACT	MITIGATION STRATEGIES
BHR 22	10 Front Street North	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. CTE for construction, new infrastructure, and two proposed shafts will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 23	25 Front Street North	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. CTE for construction, new infrastructure, and two proposed shafts will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 24	20 Lakeshore Road East	**Indirect Impact** **Rationale:** The property is not anticipated to be directly impacted by the undertaking. New infrastructure will be located adjacent to the property, as such unforeseen vibration impacts could result from construction activities.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.
BHR 25	22 Stavebank Road	**Indirect Impact** **Rationale:** Sub-surface construction works will be carried out within the boundaries of BHR 25. However, there will be no surface disturbance.	Vibration monitoring should be undertaken during construction to monitor potential vibration impacts.

7.0 CONCLUSIONS

The results of the background historical research and review of the secondary source materials, including historic mapping, revealed that the Study Area consists of lands that have been shaped by an early village settlement dating from the nineteenth century.

The following provides a summary of the assessment results:

- Three (**3**) CHLs, (**1**) HCD, and (**25**) BHRs were identified for the Port Credit East Water and Wastewater Servicing Optimization Schedule 'C' Municipal Class Environment Assessment.
- The (**2**) CHLs, (**1**) HCD, and (**8**) BHRs were included in the City of Mississauga's Heritage Register, and one (**1**) CHL and seventeen (**17**) BHRs were identified in field review.

8.0 RECOMMENDATIONS

This Cultural Heritage Report has resulted in the following recommendations:

1) Staging and construction activities should be appropriately located and/or planned to avoid impacts to the identified BHRs, CHLs, and the HCD.

2) Vibration impacts are anticipated for twenty-three (23) heritage resources: BHR 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, and 25. During adjacent construction or excavation, vibration impacts will be monitored, and work will stop immediately if vibration thresholds are exceeded.

3) No anticipated direct or indirect impacts were identified for three (3) heritage resources: BHR 1 and 2, and CHL 3. No further heritage reporting is required for these resources at this time.

4) Heritage Impact Assessments (HIAs) are recommended for three (3) heritage resources: CHL 1 and 2, and HCD 1. These resources are designated and will experience impacts to their properties as a result of the Project's undertaking. As such, HIAs are recommended to understand and identify the impacts to the cultural heritage attributes, and to recommend appropriate mitigative measures to reduce or remove the impact to the resources.

5) Should future work require expansion of the Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule 'C' Municipal Class EA Study Area, a qualified heritage consultant should be contacted to confirm the impacts of the proposed work on known or potential BHRs, CHLs, and HCD.

EXECUTIVE SUMMARY

A Phase One Environmental Site Assessment (ESA) has been completed for eight (8) Sites (the Sites) selected for proposed construction of shafts to facilitate capacity improvements for the Port Credit water and wastewater system. These Sites are located throughout the south part of the City of Mississauga within the Port Credit East area.

This report has been completed as a due-diligence technical study to support the Municipal Class Environmental Assessment (MCEA) process. As it is the understanding of the assessors (GM BluePlan) that no Record of Site Condition (RSC) will be required, this ESA has not been prepared for the intention of supporting an application for RSC to the Ministry of the Environment, Conservation and Parks (MECP).

The Phase One ESA was conducted with regard to each of the proposed shaft Sites as well as the area enclosed by a search buffer extending 100 m beyond the Site boundaries (i.e., the study area) and neighbouring lands. This Phase One ESA involved the review of numerous sources of information available from public sources and from the Region of Peel (the Client). Sources included:

- Topographic, surficial geological, MECP water well record mapping and database information
- Environmental database report from ERIS
- Limited City Directory search for select properties
- Aerial photographs
- MECP Freedom of Information records
- Fire Insurance Plans
- Site reconnaissance, and others.

The review of information identified numerous potentially contaminating activities (i.e., PCAs) within the study area. The majority of these PCAs are related to the historical or current existence of fuel storage tanks or automotive service stations and the historical occurrence of spills of potential contaminants of concern (PCOCs). Other identified PCAs include historical industrial activities, including a former starch production facility (with documented historical presence of fuel storage). The potential presence of imported fill of unknown quality was identified as a PCA for each of the Sites due to their location in a historically developed portion of the City.

The identified PCAs were assessed to determine whether the environmental risk associated with these activities was sufficient enough to be considered an Area of Potential Environmental Concern (APEC) to the subject Sites. Several of the APECs are due to PCAs that occurred at off-Site locations. Where a PCA was identified to have occurred on a proposed shaft Site, it was immediately considered to be an APEC.

The table below (see next page, also provided as Table 6 in the report) provides a summary of the identified APECs, as well as a brief description of the precipitating PCA ("Activity"), the affected Sites, the affected environmental media, and the potential contaminants of concern (PCOCs) which may be present at the Site as a result of the PCA.

Based on the APECs identified, it has been recommended that additional investigation (i.e., in the form of a Phase Two Environmental Site Assessment and/or soil quality sampling for the purposes of Excess Soil Management Plan in accordance with O. Reg. 406/19) be conducted to achieve the following objectives:

- Determine with greater certainty whether the potential impacts are present,
- Assess how the impacts may affect construction activities such as dewatering, and
- Provide soil quality assessment for the purposes of developing an Excess Soil Management Plan.

DRAFT

Table 6: Areas of Potential Environmental Concern

#	Address/ Operation	Activity	Affected Site(s)	Affected Media	PCOCs
1	20 Rosewood Ave. (Harold E Kennedy Park)	Fuel Spills Fuel Tank	LAK_3 (due to downgradient / crossgradient location	Groundwater	BTEX, PHCs F1-F4
2	160 Lakeshore Rd. E. (Midas)	Automotive Repair Garage and historic gasoline service station	LAK_3 (due to short separation distance and cross- gradient location)	Groundwater	BTEX PHCs F1-F4, VOCs
3	170 Lakeshore Road E.	Historical Gasoline Service Station and Automotive Repair Garage	LAK_3 (due to short separation distance and cross-gradient location)	Groundwater	BTEX PHCs F1-F4, VOCs
4	141 Lakeshore Rd. E. Part of a storage yard for large industrial facility (St. Lawrence Starch Co. Ltd.)	Historic industrial facility, underground fuel tanks, multiple railway spurs, ERIS records of multiple ASTs.	LAK_3, (due to short separation distance and cross-gradient location); ELM_5 and ELM_6 (short separation distance and upgradient location)	Soil / Groundwater	Soil (Metals PAHs) Groundwater (BTEX, PHCs, VOCs)
5	3 Elmwood Ave. N.	Historic "Used Car Lot" (1952 FIP)	LAK_3 (on-Site)	Soil / Groundwater	Soil (Metals PAHs) Groundwater BTEX, PHCs, VOCs
6	76 Cumberland Dr. (Hiawatha SPS)	Fuel Tank	HIA_8 (on-Site)	Soil / Groundwater	BTEX, PHCs F1-F4
7	60 Elmwood Ave. S. (Elmwood SPS)	Fuel Tank	ELM-5 and ELM-6 (due to short separation distance and cross-gradient location)	Soil / Groundwater	BTEX, PHCs F1-F4
8	182 Rosemere Rd. (Rosemere SPS)	Fuel Tank	ROS_1 (on-Site)	Soil / Groundwater	BTEX, PHCs F1-F4
9	NA	Imported Fill (on-Site)	All sites	Soil	Metals PAHs

Besides the above-mentioned APECs relevant to the shaft sites, it is noted that additional PCAs have been identified within the greater study area which may be of interest to the selection of the preferred alignment for the proposed linear works (Figures 5 a to 5e). Furthermore, as the scope of this ESA was limited to a certain study area based on the location of the proposed shaft sites, there may be additional PCAs not identified herein but which may be relevant to the linear works. Once the preferred alignment of the linear works is selected, a fulsome Phase One Environmental Site Assessment (and subsequent site investigation as applicable) for that alignment is recommended.

PHASE ONE ENVIRONMENTAL SITE ASSESSMENT FOR SCHEDULE "C" MCEA PORT CREDIT EAST WATER AND WASTEWATER SERVICING OPTIMIZATION STRATEGY

REGION OF PEEL

NOVEMBER 1, 2022

GMBP FILE: 719033

DRAFT

1. INTRODUCTION

The Region of Peel (the Region) have retained GM BluePlan Engineering Limited (GMBP) to undertake a Schedule "C" Municipal Class Environmental Assessment (MCEA) to identify, develop and implement an integrated water and wastewater optimization strategy for Port Credit East to support existing servicing needs and projected growth in the area.

The Class EA study area (hereafter referred to as the greater MCEA study area) includes the combined servicing areas for the Elmwood Sewage Pumping Station (SPS), Hiawatha SPS, Rosemere SPS and extends along Lakeshore Road East from Front Street on the west side of the Credit River to Seneca Avenue. The greater MCEA study area falls within Municipal Ward 1 in the City of Mississauga.

As part of this undertaking, this Phase One Environmental Site Assessment (ESA) report has been prepared to assist the MCEA Team to support the decision-making process as well as to provide insight as to the potential to encounter impacted environmental media (i.e., soil and groundwater) at eight (8) short-listed proposed shaft/ construction compound locations (hereafter referred to as "Sites" and adjacent lands (here after referred to as the "study area" which generally consists of about 100 m search radius from the Sites).

This Phase One ESA was undertaken to identify potential and/or actual environmental concerns or risks associated with the Sites which may have resulted from current or historical land uses on the Sites or neighbouring properties. It is our understanding that this Phase One ESA is being conducted to support the selection of preferred alternatives to achieve certain water and wastewater system upgrade/capacity expansion objectives. This Phase One ESA is not intended to support an application for Record of Site Condition per Ontario Regulation (O. Reg.) 153/04 (as amended). However, it is understood that some of the Sites are owned by parties other than the Region and so the preferred solution may involve property transfer and/or easement creation.

1.1 Site Location and Property Information

Currently, the preferred alternative for the improvements to the water and wastewater system includes eight (8) proposed shaft/construction compound locations on lands within the greater MCEA study area which also include the existing Elmwood, Rosemere and Hiawatha SPS properties and vicinity (the "Sites") as shown on Figure 1 and described in Table 1 below. These ESA Sites are located within the City of Mississauga (Geographic Township of Toronto).

Table 1: Potential Shaft Sites and Site Location Information

Site ID	Site Location	Current Use
ROS_1	Rosemere SPS (182 Rosemere Road) - Rosemere Road (between Stavebank Road and Kenollie Creek)	Region of Peel SPS Rosemere Road right-of-way
ROS_2	Sandham Road (between Mona Road and Vesta Road)	Sandham Road right-of-way
LAK_3	3 Elmwood Avenue North	Municipal parking lot
ELM_4	Elmwood Avenue South and Wanita Road	Elmwood Avenue South and Wanita Road right-of-ways
ELM_5	75 St. Lawrence Drive (St. Lawrence Park)	City Park
ELM_6	Adjacent to Elmwood SPS property (60 Elmwood Avenue South), Tall Oaks Park, west of Carlis Place	City Park adjacent to Region of Peel SPS
HIA_7	Hiawatha Parkway and Wanita Road	Hiawatha Parkway and Wanita Road right-of-ways
HIA_8	Hiawatha SPS (76 Cumberland Drive), Hiawatha Park, south of Hiawatha Parkway Cumberland Drive	Region of Peel SPS City Park

1.2 Property Ownership

Several of the Sites cross property lines and have multiple owners as listed below:

- Site ROS_1: City of Mississauga (right-of-way), Region of Peel (SPS property), private owners (portion of undeveloped private property)
- Site ROS_2: City of Mississauga (right-of-way)
- Site LAK_3: City of Mississauga (municipal parking lot)
- Site ELM_4: City of Mississauga (right-of-way)
- Site ELM_5: City of Mississauga (St. Lawrence Park)
- Site ELM_6: Region of Peel (SPS property), City of Mississauga (right-of-way and Tall Oaks Park)
- Site HIA_7: City of Mississauga
- Site HIA_8: Region of Peel (SPS property), City of Mississauga (Hiawatha Park)

2. SCOPE OF INVESTIGATION

The Phase One ESA was conducted in general accordance with the guidelines of the Canadian Standards Association (CSA) as presented in Report No. Z768-01, Phase One Environmental Site Assessment (reaffirmed 2016) as well as with reference to Ontario Regulation 153/04 (as amended), where appropriate. The purpose of a Phase One ESA is to identify actual and potential environmental concerns or risks associated with the Sites. These environmental concerns may be the result of current or historical potentially contaminating activities (PCAs) and uses of the Sites or surrounding properties. It is our understanding that this Phase One ESA is

conducted as a due-diligence investigation and that a Record of Site Condition is not required to be filed for any of the Sites included in this Phase One ESA.

The Phase One ESA process involves review of documents, maps, and other recorded information in conjunction with the observations of a reconnaissance visit to the Sites by the Assessor. Based on the information gathered, an assessment of the potential environmental concerns can be made and, if warranted, recommendations offered for further investigation. A brief description of the records reviewed, and the reconnaissance visit follows. Interviews with current Owners of the Sites were not conducted as part of this process. During the site reconnaissance of the Region of Peel SPSs (Elmwood, Hiawatha and Rosemere SPSs), Region of Peel Operations staff facilitated the Site visits.

Fire Insurance Plans (FIPs) for the Sites and the ESA study area were requested through ERIS from Opta Information Intelligence (Opta). Select FIPs from a previous ESA completed by Stantec in 2021 for the Region of Peel, for lands partially within the current ESA study area, were also reviewed. Where coverage is available, the FIPs were reviewed to assess historical ownership and uses of the Sites and the vicinity. Summary of FIP observations is enclosed in Appendix A1 with select FIPs enclosed in Appendix A2.

The Ministry of the Environment, Conservation and Parks (MECP) Waste Disposal Site Inventory (MECP 1991) was reviewed to identify closed and active waste disposal sites in the vicinity of the Sites. The Region of Peel Official Plan Waste Management Site mapping was reviewed, and additional information was obtained from Region of Peel Infrastructure, Waste Management Department files regarding locations of closed and active waste disposal sites in the vicinity of the Sites. Summary of waste disposal site information is presented in Section 3.5 and 3.6.

An environmental risk report was requested from ERIS (ERIS report) to review available historical and environmental records and provide information on reported spills, registered waste generators, fuel storage tanks among other databases of environmental significance. The ERIS report covered a search area extending at a 100 m radius from the boundaries of the Sites and adjoining properties/right-of-ways (here after referred to as the study area). A set of review notes that summarizes the ERIS report and highlights key findings is provided in Appendix B1. The ERIS Report is provided in Appendix B2.

Aerial photographs dating back to 1954 available for the Study area from the Mississauga Maps online GIS were reviewed. Aerial photographs from each available decade were reviewed, specifically years 1954, 1966, 1975, 1985, 1997, 2007, and 2017. A summary of observations from these aerial photo reviews is provided in Appendix C.

A search of the City Directory records for selected properties in the study area was requested from Environmental Risk Information Services (ERIS) to ascertain occupancy for the selected Sites and surrounding properties. The City Directory search is provided in Appendix D.

The Fuels Safety Division of the Technical Standards and Safety Authority (TSSA) was contacted for review of their records on underground and aboveground fuel storage tanks on the Sites and on select neighbouring properties. The TSSA responses are included in Appendix E.

Background available environmental records for lands within the study area were requested from the Region of Peel. Received information is summarized in Section 3.7 and copies of provided spill records are included in Appendix F.

A selection of relevant available reports from Region of Peel archives were reviewed. Select information from reviewed reports is included in Section 3.9.

A request was filed with the MECP Freedom of Information (FOI) office to acquire available records under the Freedom of Information and Protection of Privacy Act for select properties in the study area. Received records are included in Appendix G.

Background physiographic, geological, hydrogeological and topographical information for the Site and the surrounding area was assembled from several sources including the Ministry of Environment, Conservation and Parks (MECP), publications from the Ontario Geological Survey and others.

DRAFT

The MECP Record of Site Condition (RSC) Registry search provided by ERIS was reviewed to determine whether a Record of Site Condition has been submitted for the Sites or neighbouring properties. A Record of Site Condition is required to be completed as part of the process of transitioning a property of former industrial/commercial land use into one of residential, parkland, agricultural or other land use for which a more stringent environmental quality standard is applicable. As such, presence of a Record of Site Condition and associated environmental investigations for a particular property may provide information on potential for environmental impacts or risks to adjacent properties.

Water well records in the vicinity of the Sites available from the Ministry of the Environment, Conservation and Parks (MECP) (MECP 2022) were reviewed and select well records are included in Appendix H.

Reconnaissance of the Sites was completed on September 12, 2022, by Mr. Mark Ongarato, B. Sc. of GMBP. Mr. Ongarato was accompanied by Region of Peel Operations staff member during reconnaissance visits to the Region SPS facilities (Rosemere, Hiawatha and Elmwood SPSs). Mr. Ongarato was unaccompanied during the reconnaissance of the remaining Sites. Photographs of the subject Sites were taken during the reconnaissance visits and select photographs are included in Appendix I. Notes from observations of neighbouring properties are summarized in Appendix J.

3. RECORDS REVIEW

For the purpose of describing records (where appropriate), Lakeshore Road East is considered to be oriented in an east to west direction.

3.1 Phase One Study Area

The Phase One study area is a composite area that generally includes the areas within 100 m of each of the proposed construction shaft Sites as well as adjoining properties and right-of-ways. The study area boundaries are shown on Figure 1.

3.2 First Developed Use

The first developed use of each Site, as reported on available records, is listed in Table 2. For the purposes of this identification, agricultural or recreational land uses will not be listed as the “first developed use” of a Site unless that is also the present-day land use of the Site. Certain uses have been identified from aerial photos and, due to the limited resolution of the photos and difficulty discerning land use with certainty, these uses are identified as “apparent”. Approximate date of first developed use date is listed as “pre”-date of the first available reviewed record (aerial photograph or FIP) in those instances, where on the available oldest reviewed record, the property already appears as developed.

DRAFT

Table 2: First Developed Use Identified for Each Site

Site ID	First Developed Use/Record Source	Approximate Year	Notes
ROS_1 (SPS)	Right-of-Way/Greenspace (1954 aerial photograph), Rosemere SPS constructed in 1970	Between 1946 and 1954	On aerial photographs (1931 and 1946 (available in Stantec (2021), Sites appear undeveloped with what appears as early stages of residential development in general Site vicinity.
ROS_2	Right-of-Way/Greenspace	Between 1946 and 1954	
LAK_3	(Apparent) commercial use/ a parking lot, presence of structures cannot be confirmed based on low photograph resolution (1954 aerial photograph) Used Car Lot (1952 FIP)	Between 1946 and 1954	On aerial photographs (1931 and 1946, Stantec 2021) and 1928 FIP, Site appears undeveloped.
ELM_4	Right-of-way (1954 aerial photograph)	Pre-1954	On aerial 1931 photographs (Stantec 2021) Site appears undeveloped. 1946 – potential right-of-way/, not discernable.
ELM_5	Part of a storage yard for large industrial facility (St. Lawrence Starch Co. Ltd.) (1928/1952 FIP, Heritage Mississauga)	Circa 1890	
ELM_6 (SPS)	Elmwood Ave. S./Lakeview Blvd. right-of-way (1952 FIP) Elmwood SPS constructed in 1987	Pre-1928	
HIA_7	Right-of-Way (1954 aerial photograph)	Pre-1954	
HIA_8 (SPS)	Right-of-way/parkland (1952 FIP) SPS constructed circa 1950	Cumberland Dr. right-of-way pre-1928, SPS circa 1950	SPS constructed as a wet well/drywell type station circa 1950. Control building constructed in 1990.

3.3 Fire Insurance Plans

A request for Fire Insurance Plans (FIPs) was placed with ERIS for the Sites and the general study area. The FIP search was completed by Opta Information Intelligence (Opta) for lands in the study area. Select available FIPs were also reviewed from a previous ESA report prepared for the Region of Peel by Stantec (2021) for a portion of Lakeshore Road East right-of-way and surrounding area. Summary of observations from the reviewed FIPs (both in the immediate vicinity of the proposed shaft Site and greater Study Area) is presented in Appendix A1. Copies of select available FIPs are enclosed in Appendix A2 and with pertinent findings summarized below.

DRAFT

Table 3: Summary of FIP Records

Site ID	Subject Site (FIP Year)	Adjacent Lands (FIP Year)
ROS_1	- Site appears vacant (1952) - Rosemere Rd. does not appear on the FIP (1952)	- Residential north and west of Site - CNR right-of-way south/east of Site (1952)
ROS_2	- Sandham Road right-of-way (1952)	- Residential north and west of Site - CNR right-of-way south/east of Site (1952)
LAK_3	- No address listed - Site appears vacant (1928) - Used Car Lot (1952)	- Numerous properties to the west and southwest of Site with records of multiple USTs and automotive repairs (including property 25 m west of Site at 170 Lakeshore Rd. E. – historical gasoline service station) (1928 and 1952) - St. Lawrence Starch Co. Ltd. – former industrial property south of Site, with records of 3 USTs (1928 and 1952)
ELM_4	- Elmwood Ave. S./Wanita Rd. right-of-way (1952)	- Residential and vacant land to the north and east, St. Lawrence Starch Co. Ltd. to the west and south (1952)
ELM_5	- Appears to be part of a storage yard for large industrial site (St. Lawrence Starch Co. Ltd.) (1928 and 1952)	- Lake Ontario shoreline to the south, inferred residential to the north (1928 and 1952)
ELM_6 (SPS)	- Intersection of Elmwood Ave. and Lakeview Blvd. right-of-way, vacant land/Lake Ontario shoreline to south (1952)	- Residential and vacant lands, Lake Ontario Shoreline (1952)
HIA_7	- Wanita Road and Hiawatha Parkway right-of-way in a residential area (1928 and 1952)	- Appears residential (1928) - Residential (1952)
HIA_8 (SPS)	- Cumberland Dr. and Hiawatha Pkwy. right-of-way - Structure labelled as “pump house” and vacant land (inferred parkland) (1952)	- Residential - Vacant land (inferred parkland) (1928 and 1952)

Notes:

UST – Underground fuel storage tank, CNR – Canadian National Railway

Pertinent findings related to potentially contaminating activities (PCAs) identified based on FIP review are shown on Figures 5a to 5e.

DRAFT

3.4 City Directory Search

City Directory records for select properties within the study area obtained through ERIS include property use information from the years 1958 to 2001 in approximate six (6) year increments (Appendix D). City Directory records were requested for the Site addresses (if Site is part of a private/public property with an assigned civic address) as well as select properties in the Site vicinity, specifically for commercial and industrial properties. Summary of available City Directory records is enclosed in Appendix D with select pertinent details summarized below.

In the broader study area, are numerous residential, commercial, and industrial properties. The City Directory records do indicate several records related to vehicle repair/service shops, historic industrial property (starch production), gasoline service stations, as follows, with additional details included in Appendix D. Pertinent findings related to PCAs identified based on City Directory review are shown on Figures 5a to 5e.

Site ROS_1 and Site ROS_2

Due to these Sites being portions of right-of-ways, no City Directory records were requested for these Sites.

Site LAK_3

LAK_3 is located at 3 Elmwood Ave. N. City Directory listings for this property include the following:

- Address not listed – 1958, 1965, 1972-73, 1977-78, 1983, 1989, 1994, 2000

Within the 100 m immediate study area of this Site, there are numerous industrial and commercial listings at downgradient / crossgradient properties including:

- 160 Lakeshore Rd. E.
  - Elmwood Tire Service Ltd. – 1958, 1965
  - G&M Auto Service Centre – 1977-78
  - Perma-Shine – 1977-78
  - Auto Safety Centre – 1983 -1989
- 170 Lakeshore Rd. E.
  - Elmwood Motors Ltd – 1958, 1965
  - Automotive Conversion of Canada - 1965
  - Credit Valley Motor Leasing Canada Ltd – 1965, 1972-73
  - Elmwood Motors Ltd. Used Car Lot – 1972-73

Slightly beyond the 100 m immediate study area, there are numerous industrial and commercial listings at downgradient / crossgradient properties including:

- 141 Lakeshore Rd. E.
  - St. Lawrence Starch Co. Ltd. – 1958, 1965, 1972-73, 1977-78, 1983, 1989, 1994, 2000
  - Steen Mechanical Contractors – 1972-73
- 150 Lakeshore Rd. E.
  - Babcock Garage - 1965
  - Port Credit Car Wash - 1965
  - Pioneer Auto Centre – 1972-73
  - Pioneer Gas & Wash Centre – 1977-78, 1983
  - R & L Auto Glazing – 1977-78
  - Pioneer Petroleums – 1989, 1994, 2000

Site ELM_4

Site ELM_4 is located at the intersection of Elmwood Ave. S. and Wanita Rd., in a residential neighbourhood. Given that this Site is an existing right of way, City Directory records were not requested for this property.

Within the 100 m study area of this Site, there is one industrial listing at crossgradient property including:

DRAFT

- 141 Lakeshore Rd. E.
  - St. Lawrence Starch Co. Ltd. – 1958, 1965, 1972-73, 1977-78, 1983, 1989, 1994, 2000
  - Steen Mechanical Contractors – 1972-73

Slightly beyond the 100 m immediate study area, there are numerous industrial and commercial listings at upgradient / crossgradient properties including:

- 150 Lakeshore Rd. E.
  - Babcock Garage - 1965
  - Port Credit Car Wash - 1965
  - Pioneer Auto Centre – 1972-73
  - Pioneer Gas & Wash Centre – 1977-78, 1983
  - R & L Auto Glazing – 1977-78
  - Pioneer Petroleums – 1989, 1994, 2000

Site ELM_5

ELM_5 is located at a portion of St. Lawrence Park property, located at 75 St. Lawrence Dr. Given that this Site is an existing park, City Directory records were not requested for this property.

Within the 100 m immediate study area of this Site, there are numerous industrial and commercial listings at upgradient / crossgradient properties including:

- 141 Lakeshore Rd. E.
  - St. Lawrence Starch Co. Ltd., 1958, 1965, 1972-73, 1977-78, 1983, 1989-, 1994, 2001
  - Steen Mechanical Contractors – 1972-73

Slightly beyond the 100 m immediate study area, there are numerous industrial and commercial listings at upgradient / crossgradient properties including:

- 150 Lakeshore Rd. E.
  - Babcock Garage - 1965
  - Port Credit Car Wash - 1965
  - Pioneer Auto Centre – 1972-73
  - Pioneer Gas & Wash Centre – 1977-78, 1983
  - R & L Auto Glazing – 1977-78
  - Pioneer Petroleums – 1989, 1994, 2000

Site ELM_6

ELM_6 is located south of the intersection of Elmwood Ave. S. and Carlis Pl., in a residential neighbourhood. Given that this Site is an existing right-of-way, it is inferred that there are no City Directory listings for this property.

Slightly beyond the 100 m immediate study area, there are numerous industrial and commercial listings at upgradient / crossgradient properties including:

- 141 Lakeshore Rd. E.
  - St. Lawrence Starch Co. Ltd., 1958, 1965, 1972-73, 1977-78, 1983, 1989-, 1994, 2001
  - Steen Mechanical Contractors – 1972-73
- 150 Lakeshore Rd. E.
  - Babcock Garage – 1965
  - Port Credit Car Wash - 1965
  - Pioneer Auto Centre – 1972-73
  - Pioneer Gas & Wash Centre – 1977-78, 1983
  - R & L Auto Glazing – 1977-78
  - Pioneer Petroleums – 1989, 1994, 2000

DRAFT

3.5 MECP Waste Disposal Site Inventory

The Waste Disposal Site Inventory (1991) is a document prepared by the MECP that provides a listing of active and inactive waste disposal sites (landfills) at the time of publication (1991). A set of geospatial data that shows the location of each of these disposal sites has been prepared by Fortin (2005) of the University of Toronto.

Upon review, it appears that there are seven (7) waste disposal sites listed at locations within 5 km of the subject Sites. These are as follows:

- Active Class A3 site at 3.6 km north of ROS_1,
  - Class A3 designation represents a site that is in an urban area, is hazardous to humans, and is for municipal / domestic waste.
- Inactive Class A5 site at 4.6 km northwest of ROS_1, and across the Credit River,
  - Class A5 designation represents a site that is in an urban area that has been closed for 10-20 years (as of 1991), is hazardous to humans and is for municipal / domestic waste.
- Inactive Class A1 site at 1.0 km west of ROS_1, and across the Credit River,
  - Class A1 designation represents a site that is in an urban area, is hazardous to humans and is for industrial liquid / hazardous waste in urban areas.
- Inactive Class A5 site at 450 m southwest of ROS_1, and across the Credit River,
  - Class A5 designation represents a site that is in an urban area that has been closed for 10-20 years (as of 1991), is hazardous to humans and is for municipal / domestic waste.
- Inactive Class A3 site at 1.0 km southwest of ROS_1 and across the Credit River,
  - Class A3 designation represents a site that is in an urban area, is hazardous to humans, and is for municipal / domestic waste.
- Inactive Class A3 site at 1.3 km east of HIA_8,
  - Class A3 designation represents a site that is in an urban area, is hazardous to humans, and is for municipal / domestic waste.
- Inactive Class A5 site at 3.5 km east of HIA_8,
  - Class A5 designation represents a site that is in an urban area that has been closed for 10-20 years (as of 1991), is hazardous to humans and is for municipal / domestic waste.

3.6 Region of Peel Waste Disposal Site Information

The Region of Peel states in their April 2022 Official Plan that, currently, there are no active waste disposal sites in the Region of Peel. The Official Plan includes a Waste Management Sites figure that identifies several closed landfill sites and waste facilities across the Region of Peel. According to this figure and supplemental information on waste disposal sites provided by the Region, there are several closed landfill sites within 1,000 m of the subject Sites:

- Near Site ROS_1
  - Closed public landfill site, located west of Stavebank Rd. and south of the train tracks (currently Port Credit Memorial Park), approximately 150 m south of the Site (MECP No. 7069).
  - Closed public landfill site, located at 53 Lake St. (currently J.C. Saddington Park) (MECP No. 7070), approximately 900 m south of the Site, and on the west side of the Credit River.
  - Closed private landfill site located on southwest corner of Mississauga Road and Lakeshore Rd. E. (MECP No. A220107), located approximately 700 m south of subject Site, west of Credit River.
    Closed private landfill site located on northwest corner of Mississauga Road and Lakeshore Rd. E. (MECP No. A220108), located approximately 600 m south of subject Site, west of Credit River.

Based on the separation distance, and the location of these reported closed landfill sites inferred to be located downgradient of the subject Site, or at locations across the Credit River (i.e., hydraulically separate), these are not considered to be a source of impact or risk to the subject property.

DRAFT

3.7 Region of Peel Spills Records

The Region of Peel maintains a record of spills reported, whether by citizens or by the MECP Spills Action Centre.

A set of 8 spill incident records were provided by the Region of Peel corresponding to spills that occurred in the areas near the subject Sites. These spill records are enclosed in Appendix F.

The reviewed spill records are summarized as follows:

- Sanitary sewage as a result of a forcemain break or other occurrence (2 records)
- Grout in storm drain or cement washout on road (2 records)
- Small-volume gasoline or motor oil spill associated with motor vehicles (reported as sheen on a road/possible gasoline spill or "gasoline spill and smell") (2 records – same date)
- Medical waste (1 record)

Based on the nature of the spills identified, these events are not considered to be a potential source of environmental risk or impact to the Sites.

The following records were identified as being of greater significance:

- Underground oil tank found while digging (1 record)
    - 20 Rosewood Avenue – City of Mississauga recreational property (outdoor swimming pool).

There were no additional details provided regarding this record. While a record of an underground fuel storage tank is of significance, based on the reported separation distance to the reported UST location, located approximately 200 m west (crossgradient) of LAK_3 Site and 410 m and 430 m northwest (upgradient) of ELM_4 and ELM_5 Sites, respectively, the reported UST at this location is not considered to be a potential source of environmental risk or impacts to the subject Sites.

Additional spill records reported by ERIS in the study area are discussed in Sections 3.10 and 6.1.3.

3.8 MECP Freedom of Information Request

A request was filed with the MECP Freedom of Information (FOI) office to acquire available records under the Freedom of Information and Protection of Privacy Act for select properties in the study area including:

- 182 Rosemere Rd. (Rosemere SPS),
- 3 Elmwood Ave. N. (LAK_3),
- 60 Elmwood Ave. S. (Elmwood SPS),
- 75 St. Lawrence Dr. (ELM_5), and
- 76 Cumberland Dr. (HIA_8).

At the time of this report's issue, response from the FOI office indicated no records for 60 Elmwood Ave. S. and 76 Cumberland Dr. Sites.

The FOI office has located records for 182 Rosemere Rd., 3 Elmwood Ave. N., and 75 St. Lawrence Dr. Sites, however only the reports for 182 Rosemere Rd. and 75 St. Lawrence Dr. have been received by our office prior to finalizing this report. The reports for 182 Rosemere Rd. (related to operation of the SPS) and 75 St. Lawrence Dr. (related to a black fibrous algae mat report on shoreline of Lake Ontario) are not considered to be an indication of an environmental risk or impact to the subject Sites. Once the remaining records are received, should these documents indicate findings of environmental significance, they will be provided under a separate cover.

A copy of FOI response letters is provided in Appendix G.

DRAFT

3.9 Other Environmental Reports

Phase I Environmental Site Assessment. Section of Lakeshore Road East, Between Front Street and Elmwood Avenue, Mississauga, Ontario (Stantec, 2021)

In 2021, Stantec completed a Phase One ESA on lands comprising approximately 1 kilometre (km) long section of Lakeshore Rd. E., between the intersection with Front St. N./S. and the intersection of Elmwood Ave. N./S. The Stantec ESA covered portion of Lakeshore Rd. E. in the vicinity of Site LAK_3 located at 3 Elmwood Ave. N.

The Stantec ESA report (2021) identified the following potentially contaminating activities and areas of environmental concern near Sites LAK_3, ELM_4 and ELM_5:

- 170 Lakeshore Road East – historical operation of an automotive facility/historical gasoline station, associated USTs, and hazardous waste generation and storage (approximately 20 m southwest of Site LAK_3 and 230 m and 300 m northwest of Site ELM_4 and Site ELM_5, respectively).
- 160 Lakeshore Road East – historical and current operation of an automotive facility, associated USTs, and hazardous waste generation and storage (approximately 80 m southwest of Site LAK_3 and 230 m and 280 m northwest of Site ELM_4 and Site ELM_5, respectively).
- 158 Lakeshore Road East – historical operation of a retail fuel outlet with associated USTs (approximately 120 m southwest of Site LAK_3 and 250 m and 270 m northwest of Site ELM_4 and Site ELM_5, respectively).
- 141 Lakeshore Road East – historical St. Lawrence Starch Co. Ltd. – Site ELM_5 is located on portion of this former industrial property.

These properties are considered to be located crossgradient of Site LAK_3, and upgradient of Sites ELM_4 and ELM_5. Pertinent findings related to PCAs identified based on other environmental reports review are shown on Figures 5a to 5e.

Various Sewage Pumping Stations Hydrogeological Investigation Report (Cole Engineering Group Ltd., 2017), and, Geotechnical Investigation Proposed Rosemere Road Sewage Pumping Station City of Mississauga, Region of Peel, Ontario (GeoPro Consulting Limited, 2017)

In 2017, Cole Engineering Group Ltd. (Cole) completed a Hydrogeological Investigation and GeoPro Consulting Limited conducted a geotechnical investigation at the Rosemere Road SPS, as part of a wider area MCEA project for Rosemere Road and Indian Road SPSs completed by Cole. Pertinent findings related to the Rosemere Road SPS are summarized below.

- As part of the geotechnical investigation three boreholes (BH1 to BH3) were drilled to depths of 5.2 m to 16.1 metres below ground surface (mbgs). Encountered soil conditions were reported as follows:
    - Topsoil 180mm to 350 mm thick, overlying,
    - Fill consisting of (fine) sandy silt, silt and clayey silt extending to depths ranging from about 0.5 m to 2.9 mbgs, overlying,
    - Silt (BH2 and BH3), extending to depths of 1.9 m to 2.0 mbgs. Sandy silt till (BH1) extending to depth of 4.0 mbgs, overlying,
    - Clayey Silt Till (BH2 and BH3), extending to depths of 3.8 m to 4.0 mbgs. Clayey silt (BH2) to depth of 3.4 mbgs, overlying,
    - Till/Shale complex extending to depths of 5.2 to 6.1 mbgs, overlying,
    - Shale bedrock (encountered at about 6.1 mbgs at BH1)
- There were no observations related to deleterious fill material reported in the Geotechnical Investigation borehole logs. Wood fragments were reported in one of the boreholes.
- Four (4) soil samples were analysed for metals and inorganics, petroleum hydrocarbons (PHCs), and volatile organic compounds (VOCs).

DRAFT

  - Based on the results of the soil chemical analysis, no exceedances of the applicable MECP Standard were reported for PHCs, VOCs and metals in the analyzed soil samples. Concentrations of PHCs and VOCs were reported below the laboratory detection limits.
  - Elevated concentrations and exceedances of applicable MECP Table 1, Table 2 and/or Table 3 Standards were noted for electrical conductivity (EC) and/or sodium adsorption ratio (SAR) in one (1) soil sample collected from borehole BH2. These parameters are inferred to be related to de-icing salts.
- Two of the boreholes were completed as monitoring wells (one shallow and one deep). The groundwater table at the Rosemere Road SPS was found to be approximately 3.5 meters below ground surface (mbgs) to 4.6 mbgs during the Hydrogeological Investigation.
- Hydraulic conductivity values estimated from rising-head tests ranged between 8.8 $x10^{-7}$ m/s and 7.6 $x10^{-9}$ m/s.
- Based on the assessment of dewatering requirements for the proposed construction associated with the 2017 MCEA project, the groundwater pumping rate at the Rosemere Road SPS was estimated to be 106,592 L/day.
- Groundwater quality samples were collected from monitoring well at BH3 and were analyzed for City of Mississauga Storm Sewer By-Law No. 259-05 and Peel Region Sewer Use By-Law 53-2010 parameters with comparison to Provincial Water Quality Objectives (PWQO).
  - Concentrations of VOC parameters were reported below the laboratory detection limits.
  - Elevated concentrations of phosphorus, and some metals were reported above the criteria of the PWQO.

Additional desktop hydrogeological and geotechnical reports were prepared as part of the current MCEA project by Golder Associates Ltd. Select information from those reports is referenced in Section 3.11.

3.10 Environmental Database Search (ERIS Report)

The Environmental Risk Information Services (ERIS) Report contains the results of a comprehensive search of a variety of environmental databases. The search is geospatially organized so all records returned are attributed to locations within the study area, in this case 100 m from the boundary of one of the Sites (100 m immediate study area).

Many of the records returned by the ERIS Report are considered to indicate negligible or minimal risk of environmental impacts to the Sites. As such, GMBP staff have reviewed the ERIS Reports and broken down the results to identify the most significant records: this breakdown is provided in Appendix B1 and the most significant records are denoted by red text. The entire ERIS Report is provided in Appendix B2, which include detailed descriptions of the various databases that were searched and the search results for the Sites and study area.

A brief summary of the most significant results, located within the 100 m immediate study area, are provided here with the results categorized by database. Pertinent findings related to PCAs identified based on ERIS report review are shown on Figures 5a to 5e.

<u>Aboveground Storage Tanks</u>

- Four (4) records for St. Lawrence Dr., south of Compass Way – no company listed – no address listed – petroleum tank – May 22, 1998
  - 60 m north of ELM_5
  - 170 m west of ELM_4
  - 200 m northwest of ELM_6
- Two (2) records for St. Lawrence Dr., southeast of Port St. E. – no company listed – no address listed – petroleum tank – May 22, 1998
  - 100 m northwest of ELM_5
  - 250 m west of ELM_4
  - 280 m northwest of ELM_6
- One (1) record for St. Lawrence Dr., south of Waterside Dr. – no company listed – no address listed – petroleum tank – May 22, 1998

- 100 m northwest of ELM_4
- 150 m north of ELM_5
- 170 m southwest of LAK_3
- 200 m northwest of ELM_6

Certificates of Approval

- Hiawatha Pkwy. & Cumberland Dr. (76 Cumberland Dr.) - R.M. of Peel – Standby diesel generator – July 20, 1990
  - Location of HIA_8

Ontario Spills

- 1171 Stavebank Rd. (private residence) – Furnace oil tank – underground fuel oil line leak in basement – quantity unknown – February 28, 1995
  - 85 m north of ROS_1

A brief summary of the most significant results, located outside of the 100 m immediate study area, are provided here with the results categorized by database.

Above Ground Storage Tanks

- Two (2) records for St. Lawrence Dr. south of Waterside Dr. – no company listed – no address listed – petroleum tank – May 22, 1998
  - 125 m northwest of ELM_4
  - 150 m north of ELM_5
  - 180 m southwest of LAK_3
  - 210 m northwest of ELM_6
- One (1) record for Compass Way, north of Waterside Dr., and west of St Lawrence Dr. – no company listed – Petroleum Tank – May 22, 1998
  - 130 m southwest of LAK_3
  - 190 m northwest of ELM_4
  - 215 m north of ELM_5
  - 275 m northwest of ELM_6

Commercial Fuel Oil Tanks

- 80 High St. E. – Bell Canada - Fiberglass Double Wall UST – 5,000 gal FS fuel oil tank – March 6, 2014
  - 320 m southeast of ROS_2

Delisted Fuel Tanks

- 158 Lakeshore Rd. E. - Eleven (11) expired records (Beaver Fuels Management Limited – one (1) record for FS facility – five (5) records for PS piping – five (5) records for FS liquid fuel tank – dated up to March 2012 and February 2017
  - 150 m west of LAK_3
  - 275 m northwest of ELM_4
  - 300 m north of ELM_5
- 150 Lakeshore Rd. E. – one (1) record for FS gasoline station (active) – May 31, 2021; four (4) records for FS liquid fuel tank (Parkland Fuel Corporation) – expired – July 31, 2020; seven (7) records for FS liquid fuel tank (Pioneer Energy Management) – expired – July 31, 2020
  - 200 m west of LAK_3
  - 300 m northwest of ELM_4
  - 300 m north of ELM_5

Fuel Storage Tank

- 150 Lakeshore Rd. E. – Parkland Corporation and Pioneer Energy Management

DRAFT

- Parkland Corporation - Six (6) records: of which, two (2) are records for double wall UST liquid fuel storage fiberglass tanks (60,000L) – installed March 20, 2012; one (1) is a record for double wall UST liquid fuel storage fiberglass tank (50,000L) installed May 8, 2009; two (2) are records for double wall UST liquid fuel storage fiberglass tank (29,000L), installed May 8, 2009; and one (1) is a record for double wall UST liquid fuel fiberglass tank (20,000L) installed May 8, 2009.
- Pioneer Energy Management Inc - Six (6) records: of which, four (4) records are for internally lined steel liquid fuel single wall UST (22,700L), installed October 2, 1989, and two (2) are records for sacrificial anode steel liquid fuel single wall UST (13,600L) installed on May 18, 1993.
- 200 m west of LAK_3
- 300 m northwest of ELM_4
- 300 m north of ELM_5

Fuel Storage Tank Historic

- Two (2) records for 150 Lakeshore Rd. E. (Pioneer Petroleums Management Inc.); of which, one (1) record is for 4 active liquid fuel double wall UST – gasoline (sized 20,000 L, 50,000 L, 29,000 L, and 29,000 L) each installed in 1995; and one (1) record is for the removal of six (6) liquid fuel single wall UST – gasoline tanks (sized 22,700 L, 22,700L, 22,700 L, 22,700 L, 13,600 L, and 13,600 L) installed in 1978 and removed as of August 2007.

Ontario Spills

- 20 Rosewood Ave. – Greenspoon Specialty Contracting Ltd – Construction Site – diesel fuel and water mixture – soil contamination – underground tank leak – UST 500 L diesel & water to ground – June 18, 2010
  - 200 m northwest of LAK_3
  - 410 m northwest of ELM_4
  - 430 m northwest of ELM_5
  - The potential risk due to the spill may be mitigated by the 200 m separation distance from the nearest site (LAK_3).
- 150 Lakeshore Rd E - Pioneer Petroleums Ltd – Service station – unknown quantity of gasoline to ground, leak detector line break – March 23, 1995
  - 200 m west of LAK_3
  - 300 m northwest of ELM_4
  - 300 m north of ELM_5
  - The potential risk due to the spill may be mitigated by the relative location of the spill from the Site (i.e., crossgradient), combined with a 200 m separation distance from the nearest site (LAK_3).

Fuel Spills and Leaks

- 20 Rosewood Ave – Fuel oil spill – petroleum product – “20 to 30 feet maybe more” – UST hit by backhoe – June 18, 2010
  - 230 m northwest of LAK_3
  - The potential risk due to the spill may be mitigated by the 230 m separation distance from the nearest site (LAK_3).

Private and Retail Fuel Storage Tanks

- Five (5) retail records for 150 Lakeshore Rd E - of which, one (1) record with no further information other than for retail, and the remaining four (4) are for Pioneer Petroleums, having expiry dates March 31, 1994, July 31, 1995 (2,000 L capacity), March 31, 1996 (118,000 L capacity), and July 31, 1995 (2,000 L capacity)
  - 200 m west of LAK_3
  - 300 m northwest of ELM_4
  - 300 m north of ELM_5

DRAFT

The ERIS report is included in Appendix B2, with pertinent findings related to PCAs identified based on ERIS report review shown on Figures 5a to 5e.

3.11 Physical Setting

3.11.1 Aerial Photographs

Aerial photographs available from Mississauga Maps (City of Mississauga 2022) were reviewed for each of the Sites for the following years: 1954, 1966, 1975, 1985, 1997, 2007, and 2017.

Historically, the Sites have generally existed in developed areas (mainly residential, but also some commercial and industrial). A large industrial starch processing facility (St. Lawrence Starch Company) was previously located at 141 Lakeshore Rd. E and occupied the block between Elmwood Ave. S and St. Lawrence Dr. According to online sources, this facility opened in 1890 and ceased operations in March of 1990. This property has since been redeveloped into a residential townhouse development.

Currently, the Sites exist in developed areas (mainly residential, with some commercial and industrial land uses along Lakeshore Rd. E.)

A summary of detailed notes taken during the aerial photo review is provided in Appendix C. The following is a brief breakdown of land-use activities of potential concern that were identified in the review.

ROS_1

- 1954 through 2017: the Site appears as a paved right-of-way (Rosemere Rd.) and green space. Four (4) residential dwellings appear on the north side of Rosemere Rd. (Potential for imported fill of unknown quality).
- Based on photograph resolution, it is unclear whether the Rosemere SPS was constructed prior to 1954.
- Circa 1954 through 2017: nearby railway tracks (approximately 50 m south of the Site) appear to travel in an east / west direction. Potential for imported fill of unknown quality, and rail yards, tracks, and spurs.
- No apparent changes to the Site or nearby railway tracks.

ROS_2

- Circa 1954 through 2017: the Site appears as a paved right-of-way (Sandham Rd.). Potential for imported fill of unknown quality.
- Prior to 1954, nearby railway tracks (approximately 50 m south of the Site) appear to travel in an east / west direction. Potential for imported fill of unknown quality, and rail yards, tracks, and spurs.
- No apparent changes to the Site or nearby railway tracks.

LAK_3

- Circa 1954: The Site appears as a parking lot, surrounded by mixed commercial and residential properties on all sides. Potential for imported fill of unknown quality.
- Circa 1966: The Site appears to have very slightly increased in size towards the east property boundary. Potential for imported fill of unknown quality.
- Circa 1954 through 1997: Large industrial facility (St. Lawrence Starch Co. Ltd.) in operation approximately 50 m southwest of the Site.
- Circa 1997: The large industrial facility appears to have been demolished.
- Circa 2007: The demolished large industrial facility appears to have been redeveloped into a residential subdivision.
- Circa 2007 to present: no apparent changes to the Site or redeveloped subdivision property.

ELM_4

- Circa 1954 through 2017: The Site appears as a paved “T” intersection in a residential neighbourhood. Potential for imported fill of unknown quality.

DRAFT

- Circa 1954 through 1997: Large industrial facility (St. Lawrence Starch Co. Ltd.) in operation approximately 25 m west of the Site.
- Circa 1997: The large industrial facility appears to have been demolished.
- Circa 2007: The demolished large industrial facility property appears to have been redeveloped into a residential subdivision.
- Circa 2007 to present: No apparent changes to the Site or redeveloped subdivision property

ELM_5

- Circa 1954: The Site appears as what is inferred as a portion of Lake Ontario (i.e., not land) and partially portion of a large industrial facility yard.
- Circa 1966: An extended shoreline appears to have been constructed on portion of Site. The newly constructed shoreline area appears to be partially used as an outdoor industrial yard, associated with the large industrial facility (St. Lawrence Starch Co. Ltd.) to the north.
- Circa 1975: The shoreline appears to have been enlarged (i.e., the Site) to approximately the size that exists today (2022).
- Circa 1985: The shoreline area appears vacant (i.e., no longer appears as an outdoor industrial yard). Immediately north of the Site, a building appears to have been demolished.
- Circa 1997: The large industrial facility (north of the Site) appears to have been demolished.
- Circa 2007: A “Waterfront Trail” and grassed area have been constructed at the Site. The demolished industrial facility has been redeveloped into a residential subdivision.
- Circa 2017 to present: No apparent changes to the Site.

ELM_6

- Circa 1954: The Site appears as a right-of-way at the southernmost portion of Elmwood Ave. S. Potential for imported fill of unknown quality.
- Circa 1966: An extended shoreline appears to have been constructed, and a small residential cul-de-sac (Carlis Pl.) has been developed at the southern end of Elmwood Ave. S. Potential imported fill of unknown material.
- Circa 1997: A building located at 60 Elmwood Ave. S., (inferred to be the Elmwood SPS) appears to have been developed.
- Circa 2007: No apparent changes to the Site or the surrounding area.

HIA_7

- Circa 1954: The Site appears as a 4-way intersection in a residential neighbourhood, with no concerns identified.
- Circa 2017: No apparent changes to the Site or the surrounding area.

HIA_8

- Circa 1954: The Site appears as a “T”-intersection and a portion of parkland in a residential neighbourhood, with no concerns identified.
- Circa 2017: No apparent changes to the Site or the surrounding area.

DRAFT

3.11.2 Topography, Hydrology, Geology

On a regional scale, the Sites are spread across an area that generally slopes southeastward toward Lake Ontario. Topographically, the Sites are relatively flat and are at similar grades as adjacent properties.

Based on the physiographic and quaternary mapping (Figures 2 and 3), the Sites are located in the physiographic region known as the Iroquois Plain and within the Sand Plains physiographic landform (Chapman and Putnam 1984). The glacial Iroquois Plain consist of generally glaciolacustrine sediments that primarily consist of sand, silt and gravel, with a shallow cover of glacial till remaining over the bedrock.

The Iroquois Plain is named after the glacial Lake Iroquois which was situated in roughly the same basin area occupied by Lake Ontario today. This region was inundated by then-Lake Iroquois and so lacustrine and deltaic deposits dominate, as well as alluvial deposits formed by more recent stream erosion.

Geologically, the Sites lie generally within areas dominated by Modern Alluvium (Site ROS_1), Deltaic and Lacustrine deposits (Sites ROS_1 and ROS_2), as well as Glaciolacustrine deposits (remaining sites) (refer to Table 3 and Figure 4). Bedrock in the vicinity of the Sites is the shale-rich Georgian Bay Formation.

Table 4: Surficial Geological Characterization

Site ID	Surficial Geology
ROS_1 (SPS)	Modern Alluvium[1] Deltaic and Lacustrine Deposits [2]
ROS_2	Deltaic and Lacustrine Deposits [2]
LAK_3	Glaciolacustrine Deposits[3]
ELM_4	
ELM_5	
ELM_6 (SPS)	
HIA_7	
HIA_8 (SPS)	

Notes:

[1] Modern Alluvium - Stratified deposits of gravel, sand, silt and clay laid down by streams, may contain organic remains.

[2] Deltaic and Lacustrine Deposits (coarse textured)– sand, gravel, minor silt and clay (Foreshore and basinal deposits)

[3] Glaciolacustrine Deposits (fine textured) - *silt and clay, minor sand and gravel Interbedded silt and clay and gritty, pebbly flow till and rainout deposits*

The Georgian Bay Formation bedrock underlies the City of Mississauga in the vicinity of the Sites (Ontario Geological Survey 2011) and the Sites lie near the boundary with the Queenston Formation bedrock unit. Georgian Bay Formation is an Upper Ordovician-age deposit consisting mainly of shale (blue-grey to brown to black). It also contains thin layers of limestone, dolostone and calcareous (i.e., calcium carbonate-rich) siltstones interbedded in the shale (Armstrong and Dodge 2007). The Queenston Formation shale is also interbedded with limestone, siltstone and dolostone.

The upper portion of the bedrock is weathered, and the weathered bedrock unit often extends for a significant thickness (several metres). In some locations the weathered bedrock forms a till-shale complex with overlying glacial till deposits.

In the previous investigations reviewed as part of the MCEA process, the bedrock surface was encountered between 4.2 m and 17.2 mbgs along Lakeshore Road and between 5.5 m and 10.7 mbgs north of Lakeshore Road near the Canadian Pacific Railway (i.e. near the location of the Rosemere SPS) (GMBP 2022).

In terms of hydrology, the Sites lie within the Lower Credit River watershed. On a local scale:

DRAFT

- Sites (ROS_1 and ROS_2) are located in the catchment associated with Kenollie/Mary Fix Creek and the Credit River,
- The remaining Sites are located in the catchment associated with Lake Ontario,
- The drainage for most of the Sites is controlled by the municipal stormwater management system (i.e., storm drains, roads), and
- Generally, groundwater flow tends in a southeasterly direction toward Lake Ontario, though flow directions may vary in areas close to riparian areas and watercourses, such as Kenollie Creek, Mary Fix Creek and the Credit River.

3.11.3 Water Bodies, Areas of Natural and Scientific Significance and Significant Wetlands

Areas of Natural and Scientific Interest (ANSI) are determined by the Ministry of Northern Development, Mines, Natural Resources and Forestry (MNDMNRF) using evaluation procedures developed by the province to assess areas of land and/or water containing natural landscapes or features which have been identified as having life science or earth science (or both) values related to natural heritage protection, scientific study, or education.

There is no ANSI immediately within the greater Port Credit East MCEA study area. However, according to the Natural Heritage Information Centre (NHIC), the Credit River Coastal Marsh is directly adjacent and is just outside of the northwest portion of the greater study area (GMBP 2022).

A wetland is determined to be a provincially significant wetland (PSW) by the MNDMNRF using the Ontario Wetland Evaluation System (OWES) – a science-based methodology used to evaluate and rank the relative value of wetlands. Wetlands are evaluated for significance based on a range of criteria, including biology, hydrology, societal value, and special features.

As reported, there are no mapped PSWs, other evaluated wetlands, or unevaluated wetlands that are directly within the greater Port Credit East study area. However, according to City of Mississauga's Official Plan Schedule 3, the southern portion of the Rosemere SPS Site (i.e., ROS_1) overlaps the 120-metre buffer zone associated with the Credit River Marshes PSW Complex (GMBP 2022). Additionally, based on the NHIC, the Rosemere Site is located approximately 150 metres northeast of the complex, which is adjacent and just outside of the greater Port Credit East MCEA Study Area (GMBP 2022)

Several of the Sites lie within 500 m of waterbodies or features of natural significance. These are summarized in Table 5.

DRAFT

Table 5: Waterbodies, Watercourses and Wooded Areas near the Sites. "~" indicates no waterbody or watercourse identified within 500 m.

Site ID	Feature or Waterbody	Distance from Site
ROS_1 (SPS)	Kenollie Creek, Mary Fix Creek and associated wooded areas Credit River and associated wooded area and marshes complex	Adjacent 180 m SW
ROS_2	Mary Fix Creek Credit River	Adjacent 460 m SW
LAK_3	~	~
ELM_4	~	~
ELM_5	Lake Ontario	Adjacent
ELM_6 (SPS)	Lake Ontario and associated wooded area	Adjacent
HIA_7	~	~
HIA_8 (SPS)	Lake Ontario	Adjacent

3.11.4 Fill Materials

The majority of the Sites are located along major or minor thoroughfares which would likely have been subject to area or roadway grading activities. Based on the age of the development throughout the study area, it is likely that (where fill was required) fill materials were not closely scrutinized for quality before being placed for construction. Based on the aerial photograph survey and the general locations of the various Sites, it is interpreted that there is some potential for imported fill materials of unknown quality to exist at all of the Sites, particularly Site ELM_5, which based on aerial photographs appears to have been filled as part of a Lake Ontario shoreline extension (portion of Site appears to have been previously under water).

3.11.5 Water Well Records

Select well records in the vicinity of the subject Sites were reviewed. Based on well records review, the shallow overburden soils are described as sand with silt and/or gravel and/or clay; silt or clay till; clay; clay with silt; sand; silt with sand and/or clay underlain by silt with clay and sand; sand with gravel; sand with silt or clay; clay; silt with sand and/or gravel; clay with gravel; clay with silt and gravel; silt or sand till; sand; layered shale deposits (MECP 2022). The reviewed well records are generally for monitoring/observation wells and well decommissioning records. Select well records in the vicinity of the Sites are enclosed in Appendix H.

In the background Hydrogeological Report which included the review of water well records for the greater MCEA study area, Golder Associates Ltd. (2022) reported that based on availability of municipal services, groundwater is not expected to be used for potable water supply in the study area and no records listed as private or domestic water wells were identified in the greater MCEA study area. Two primary aquifers were identified, a shallow unconfined or partially confined aquifer and a deep bedrock aquifer (Golder 2022). Based on MECP water well records, the depth to bedrock is reported in the range of 7 to 14.9 mbgs, with shallow groundwater level in the range of approximately 1.2 mbgs to 1.7 mbgs (Golder Associates Ltd. 2022, MECP 2022).

DRAFT

4. INTERVIEWS

The Region SPS properties (Rosemere, Hiawatha and Elmwood SPS) site reconnaissance was completed with an Operator from the Region of Peel Maintenance Department, who has been with the Region of Peel for the past 17 years and has been performing routine maintenance at these SPS properties. Relevant information obtained from the Region of Peel Operator is included in Section 5.1.

An information request has been placed with the City of Mississauga for records and reports of environmental significance for City of Mississauga owned properties. Records from City of Mississauga were not received at the time this report was issued. Once received, findings will be incorporated into this report. Interviews were not conducted in relation to City of Mississauga owned lands.

5. SITE RECONNAISSANCE

The site reconnaissance visit was completed by Mr. Mark Ongarato, B.Sc., of GMBP on September 12, 2022, from approximately 10:00 AM to 2:00 PM. Mr. Ongarato was accompanied by Zoltan, maintenance Operator for Region of Peel, during the SPS properties site reconnaissance visits.

The weather conditions at the time of site reconnaissance were rainy, changing to overcast, and a temperature of approximately 20ºC. During the site reconnaissance, photographs were taken and select photographs are presented in Appendix I.

5.1 Site Observations

ROS_1

This Site is located in a residential area on Rosemere Rd., which is approximately 90 m long and spans from Stavebank Rd. on the west side to Rosemere SPS at the east side. The Site features a paved asphalt roadway, (Rosemere Rd.), a municipal sewage pumping station (Rosemere SPS), and a concrete wet well (approximately 5 m north of Rosemere SPS). A municipal sewer was installed in Rosemere Rd. in 1969 per existing manhole cover. An older wet well was reported to be located 10 m north of the existing pumphouse. This wet well was reported to be upgraded to its current structure a number of years ago. There are also overhead power lines and utility poles on the north side of Rosemere Rd.

There was no visual evidence of extensive refuse or debris, stressed vegetation or surficial soil staining observed at the time of the site visit.

Rosemere SPS

Rosemere SPS was reported to be originally constructed at the time of the surrounding residential development (circa 1970s). This SPS is located at the far east end of Rosemere Rd. and utilizes two pumps. The SPS building hosts a double-walled backup generator diesel fuel tank that has a concrete secondary containment area. At the time of reconnaissance, the diesel tank was approximately ¾ full of diesel fuel. The SPS generator, diesel fuel tank, and control panels are elevated above ground level to meet floodplain requirements. A steel platform exists on the exterior portion of the building for refueling purposes. The diesel fuel storage tank is reported to be refuelled / topped up once per year (or more often in the event of a rare power outage incident that could cause the generator to run for an extended period of time).

A single bottle of antifreeze coolant (tied with zip-ties to the generator) is stored in this SPS. No other chemicals were reported to be used at this SPS facility. The floors are cleaned as needed with water using a hose in the SPS building. The SPS building is generally well maintained.

DRAFT

ROS_2

This Site is located in a residential area on Sandham Rd. (within the right-of-way), which is approximately 100 m long and spans between Mona Rd. and Vesta Dr. There are no properties with frontage along Sandham Rd. There is overhead street lighting, but no overhead power lines along Sandham Rd. There are two manhole covers (one sanitary sewer, one storm sewer) located at the east end of Sandham Rd. A chain-link fence runs parallel on the south side of Sandham Rd.

There was some evidence of inert domestic debris along the chain-link fence, located immediately south of Sandham Rd. Otherwise, the Site was generally well maintained with no stressed vegetation or surficial soil staining observed at the time of the site visit.

LAK_3

This Site is located in a commercial area at the northeast corner of Lakeshore Rd. E. and Elmwood Ave. S. with access via Elmwood Ave. S. This Site is approximately 1,750 m^2 (50 m x 35 m) in size and is currently used as a municipal parking lot (approximately 60 vehicle capacity). There are currently no constructed buildings on the property. Three (3) flush mount monitoring wells were identified while on-Site; one (1) on the east portion of the parking lot, and two (2) on the west portion (one (1) at each entrance). The monitoring wells were not opened while on-Site.

ELM_4

This Site is located in a residential area and consists of a T-intersection at Elmwood Ave. S. and Wanita Rd. right-of-ways. Four manhole covers were observed on-Site (two sewer and two storm). A concrete curb runs along the edges of both roads which are paved, with concrete sidewalk along the north side of Wanita Rd. and along the west side of Elmwood Ave. S. There are also overhead power lines and utility poles on the east side of Elmwood Ave. S. Overhead power lines also cross Elmwood Ave. S. at Wanita Rd.

There was no visual evidence of extensive refuse or debris, stressed vegetation or surficial soil staining observed at the time of the site visit.

ELM_5

This Site is located within St. Lawrence Park (located at 75 St. Lawrence Dr.) between St. Lawrence Dr. (to the north) and the Waterfront Trail (to the south) and is located approximately 60 m northeast of the Elmwood SPS property. Beyond St. Lawrence Dr. is a residential development. This Site features a maintained grass area with an irrigation system and a portion of a nearby paved walking trail (Waterfront Trail). Overhead lighting was observed along the Waterfront Trail.

There was no visual evidence of extensive refuse or debris, or surficial soil staining observed at the time of the site visit in the areas observed.

Elmwood SPS

The SPS was reported to be originally installed at the time of the surrounding residential development (circa 1987). This SPS is located approximately 50 m west of Elmwood Ave. S., in Tall Oaks Park, and utilizes three (3) pumps. This SPS building hosts a double-walled backup generator diesel fuel storage tank. At the time of inspection, the diesel tank was approximately ¾ full of diesel fuel. A steel platform exists on the exterior portion of the building for refueling purposes. The diesel tank is reported to be refuelled once per year (or more often in the event of a rare power outage incident that could cause the generator to run for an extended period of time).

Maintenance Operator reported no spills and that no chemicals are used or stored at this SPS location. The SPS overflow storage chambers are reported to be cleaned annually. The SPS building is generally well maintained.

DRAFT

ELM_6

This Site is located in a residential area and occupies a portion of T-intersection at Elmwood Ave. S. and Carlis Pl. right-of-ways and a portion of the adjacent parkland (Tall Oaks Park). Five manhole covers (three (3) sanitary sewer and two (2) storm) were observed at the intersection. A concrete curb runs along the edges of both roads, with concrete sidewalk along the west side of Elmwood Ave. S. There are also overhead power lines and utility poles on the east side of Elmwood Ave. S. Overhead power lines also cross Elmwood Ave. S. at Carlis Pl.

There was no visual evidence of extensive refuse or debris, or surficial soil staining observed at the time of the site visit in the areas observed.

HIA_7

This Site is located in a residential area and occupies the 4-way intersection at Wanita Rd. and Hiawatha Pkwy. This paved asphalt, 4-way-stop intersection, comprises seven manhole covers (3 sanitary sewer, 4 storm) and features a concrete curb along the outer edges of the paved roads. A concrete sidewalk runs along the northern side of Wanita Rd. There are also overhead power lines and utility poles on the north side of Wanita Rd. and east side of Hiawatha Pkwy.

There was no visual evidence of extensive refuse or debris, or surficial soil staining observed at the time of the site visit in the areas observed.

HIA_8

This Site is located in a residential/parkland land use setting, in Hiawatha Park. The Site is immediately south of Hiawatha Pkwy. and Cumberland Dr. intersection. A concrete sidewalk runs along the northern side of Wanita Rd. There are also overhead power lines and utility poles on the south side of Cumberland Dr., at the entrance to Hiawatha Park.

Hiawatha SPS

This SPS was reported to be originally installed at the time of the surrounding residential development (circa 1950s). This SPS is located approximately 15 m south of Hiawatha Pkwy. and Cumberland Dr., in Hiawatha Park, and utilizes two pumps. This SPS building hosts a double-walled backup generator diesel fuel storage tank. At the time of site visit, the diesel tank was approximately ¾ full of diesel fuel. A steel platform exists on the exterior portion of the building for refueling purposes. The diesel tank is reported to be refuelled once per year (or more often in the event of a rare power outage incident that could cause the generator to run for an extended period of time).

Maintenance Operator reported no spills and that no chemicals are used or stored at this SPS location. The SPS building is generally well maintained.

5.2 Observations at Adjacent Properties

Adjacent and nearby properties were observed from public right-of-ways during the Site reconnaissance visits. Adjacent neighbouring properties are shown on Figure 5b to 5e. Further details of activities at the neighbouring properties are contained in the FIPs (Appendix A1/A2), the ERIS report (Appendix B1/B2), aerial photographs (Appendix C), City Directory (Appendix D), with selected pertinent details discussed below. Select Site photographs and notes from the site visit are presented in Appendix I and J.

Current land use of neighbouring properties within the study area is predominantly residential (Sites ROS_1, ROS_2, ELM_4, ELM_5, ELM_6, HIA_7, and HIA_8) with mixed commercial / residential commercial land uses near Site LAK_3. Sites ELM_6 and HIA_8 are located within residential and parkland land use settings.

The following is a brief summary of land-use activities that were identified in the review of neighbouring property uses. Additional details from the Site visit are presented in a site visit memo (Appendix J).

Site ROS_1

- This Site is located along the entirety of Rosemere Rd., a dead-end residential road off the east side of Stavebank Rd., approximately 200 m north of Park St. E.
- Approximately 50 m south of the Site is a GO railway right-of-way and a train passenger boarding station with three sets of tracks travelling in an east / west direction.
- Approximately 25 m south of the Site is a municipal drainage channel (Mary Fix Creek), oriented in an east / west direction, which flows west towards the Credit River (located approximately 250 m downstream).

Site ROS_2

- This Site is located along the entirety of Sandham Rd., a residential road right-of-way situated between Mona Rd. (to the west) and Vesta Rd. (to the east), approximately 200 m south of Inglewood Dr.
- Approximately 50 m south of the Site is a railway crossing (GO train) with three sets of tracks travelling in an east / west direction.
- Approximately 25 m south of the Site hosts a municipal drainage ditch, oriented in an east / west direction, and flows west towards the Credit River (approximately 550 m downstream).

Site LAK_3

- This Site is located at the northeast corner of Elmwood Ave. N. and Lakeshore Rd. E.
- Approximately 100 m west of the Site is an automotive repair shop / garage occupied by Midas. The Midas building features a two-bay repair shop and a sales area.
- Approximately 90 m southeast of the Site hosts a coin-laundry facility (Washpro Coin Laundromats), located in a strip mall at 195 Lakeshore Rd. E. The laundromat appeared to feature approximately 15 - 20 washer / dryer machines.
- Approximately 200 m to the west of the Site hosts a Pioneer Gas Station, located at 150 Lakeshore Rd. E., which features 10 gasoline fueling pumps, an automatic car wash building, and a convenience store building.

Site ELM_4

- This Site is located at the intersection of Elmwood Ave. S. and Wanita Rd., approximately 200 m south of Lakeshore Rd. E.
- Approximately 200 m north / northeast of the Site hosts a coin-laundry facility (Washpro Coin Laundromats), located in a strip mall at 195 Lakeshore Rd. E. The laundromat appeared to feature approximately 15 - 20 washer / dryer machines.
- Approximately 250 m northwest of the Site hosts a Midas auto repair shop (160 Lakeshore Rd. E), which features a two-bay repair shop and a sales area.

Site ELM_5

- This Site is located in St. Lawrence Park, immediately south of St. Lawrence Dr. and Compass Way.
- To the north, east and west of the Site hosts residential property uses.
- Approximately 50 m to the east of the site hosts Tall Oaks Park and Elmwood SPS property.
- Immediately to the south is Lake Ontario.

Site ELM_6

- This Site is located at the intersection of Elmwood Ave. S. and Carlis Pl., and approximately 300 m south of Lakeshore Rd. E.
- Approximately 300 m north / northeast of the Site hosts a coin-laundry facility (Washpro Coin Laundromats), located in a strip mall at 195 Lakeshore Rd E. The laundromat appeared to feature approximately 15 - 20 washer / dryer machines.

Site HIA_7

- This Site is located at the intersection of Hiawatha Pkwy. and Wanita Rd. approximately 200 m south of Lakeshore Rd. E.

DRAFT

- This Site is surrounded by residential properties on all sides and is approximately 175 m north of Hiawatha Park.

Site HIA_8

- This Site is located at the northern portion of Hiawatha Park and portion of the intersection of Hiawatha Pkwy. and Cumberland Dr. approximately 175 m south of Wanita Rd.
- This Site is immediately north of Lake Ontario and is surrounded by residential properties on all sides.

6. REVIEW AND EVALUATION OF INFORMATION

6.1 Identification and Evaluation of Potentially Contaminating Activities

Certain industrial and land use activities are listed under Table 2 of Ontario Regulation 153/04 as being "Potentially-Contaminating Activities" (PCAs). These are activities which have an increased potential of causing environmental impacts to their host sites and also, under certain conditions, to surrounding areas or neighbouring sites.

This section will identify the categories of PCAs that have been identified within the study area. Within each category, an assessment will be completed to determine whether or not these PCAs should be considered as Areas of Potential Environmental Concern (APECs) with regard to the shaft Site(s). An Area of Potential Environmental Concern indicates that there is an elevated probability for environmental impacts at the Site due to the existence of a PCA and the prevailing conditions, be they soil, groundwater, topographic, regulatory.

Identified APECs will be recommended for additional investigation or risk mitigation approaches, as applicable.

Figures 5a through 5e show the locations of the identified PCAs within the study area which are considered to be more significant or may act as potential sources of environmental impact or risk to the subject Sites.

6.1.1 Waste Disposal Sites

As discussed in Section 3.5, the records review has indicated the presence of historical landfills/waste disposal sites within 1000-m from the Sites. However, the potential for these landfill areas to have impacted the Sites is mitigated for the following reasons:

- Hydraulic Separation:
  - The closed waste disposal site located approximately 150 m west/southwest of ROS_1 (e.g., current location of Port Credit Memorial Park at 40 Lakeshore Rd. E.) is on the opposite side of Mary Fix Creek from the Site. It is expected that Mary Fix Creek serves as a drainage divide in this area and that this obstructs the pathway for contaminants to reach the Site.
  - The closed waste disposal site located approximately 900 m southwest of ROS_1, (e.g., current location of J.C. Saddington Park at 53 Lake St.) is on the opposite side of the Credit River from the Site. It is expected that Credit River serves as a drainage divide in this area and that this obstructs the pathway for contaminants to reach the Site.

- Hydraulic Gradient
  - The waste disposal site located approximately 150 m southwest of ROS_1 (e.g., current location of Port Credit Memorial Park at 40 Lakeshore Rd. E.) is located downgradient of ROS_1.
  - Closed private landfill site located on southwest corner of Mississauga Road and Lakeshore Rd. E. (MECP No. A220107), is located approximately 700 m south of subject Site, west of Credit River.
    Closed private landfill site located on northwest corner of Mississauga Road and Lakeshore Rd. E. (MECP No. A220108), located approximately 600 m south of subject Site, west of Credit River.
  - The remaining inactive waste disposal sites are located beyond 1 km of the subject Site and are generally located hydraulically crossgradient to subject Site. As such, based on the separation

distance and the hydraulically separate locations of these former waste disposal sites, these are not considered to be a source of environmental impact or risk to subject Site.

Shaft Sites: These reported waste disposal sites are not considered to be an APEC with respect to the subject Sites.

Linear Works: These reported waste disposal sites are not considered to be an APEC with respect to the potential linear works.

6.1.2 Records of Site Condition (RSC)

A Record of Site Condition (RSC) sets out the environmental condition of a property at a particular point in time based on environmental site investigations conducted by a Qualified Person (QP). An RSC must be filed with the Ministry of the Environment, Conservation and Parks (MECP) before property use changes in certain ways (typically to a more sensitive land use designation such as residential).

The ERIS report indicated one (1) record where a RSC was acquired for a property within the study area, approximately 210 m southwest (crossgradient) of the Site LAK_3 and 280 northwest (upgradient) of Site ELM_5. This RSC record is described in further detail below:

- 15 Hurontario St. – F.S. Port Credit Development Limited – RSC filed November 16, 2007
  - Property use changed from commercial to residential.
  - Site reported to meet the full depth site condition standard, with nonpotable ground water, course textured soil, for residential / parkland / institutional property use.
  - Approximately 210 m southwest of nearest Site (LAK_3) and 280 northwest of Site ELM_5.
  - Shaft Site: Based on the separation distance between this reported RSC site and the subject Sites, the reported RSC site is not considered to be a source or risk or impact to the subject Sites.
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.

6.1.3 Spills

Spills of fuel, oil, or other hazardous material may result in a lasting environmental impact to soil or groundwater if not properly controlled or remediated.

Region of Peel provided internal records for the subject Sites and the vicinity. Several spills were identified to be within the vicinity of the subject Sites, however these were identified to be of low risk in the context of potential for causing environmental impact (e.g. medical waste, grout and sewage spills) or based on the reported location and the separation distance (small volume of gasoline or motor oil) as summarized in Section 3.7.

The ERIS report indicated a few instances where higher risk materials (e.g., PCB-laden oil, fuels) were spilled in non-trivial quantities (e.g., >100 L) in the vicinity of the Sites. Each will be addressed in turn here:

<u>Ontario Spills and Fuel Oil Spills and Leaks Databases</u>

- 1171 Stavebank Rd. (private residence) – Furnace oil tank – underground fuel oil line leak in basement – quantity unknown – February 28, 1995
  - Due to the nature of this spill record and the nature of the contaminants involved (85 m northwest of ROS_1), there is not considered to be elevated potential for environmental impacts due to this activity.
  - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site.
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.

- 20 Rosewood Ave. – Greenspoon Specialty Contracting Ltd – Construction Site – diesel fuel and water mixture – soil contamination – underground tank leak – UST 500 L diesel and water to ground – June 18, 2010. incident described as “UST hit by backhoe”.
  - Due to the nature of this spill record and the contaminants involved there is considered to be elevated potential for environmental impacts due to this activity.

- Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site.
- Linear Works: This PCA is considered to be an APEC with respect to potential linear works.

- 150 Lakeshore Rd. E. - Pioneer Petroleums Ltd – Service station – unknown quantity of gasoline to ground, leak detector line break – March 23, 1995
  - Due to the nature of this spill record, its age (1995) and therefore duration of potential risk exposure, and the contaminants involved, there is considered to be elevated potential for environmental impacts due to this activity.
  - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site.
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.

6.1.4 Tanks of Fuel and Associated Products

Historically, liquid fuel tanks (e.g., of gasoline, diesel, or other petroleum fuels) have commonly been sources of environmental impacts. This is especially true in the case of underground storage tanks which, prior to monitoring and leak detection technologies becoming commonplace, may have had leaks that went undetected for long periods of time, thus allowing the release of substantial quantities of petroleum-derived chemicals into the subsurface. Furthermore, tanks are often used at industrial sites and other mechanical facilities to hold waste oil, grease, and other potential contaminants of concern.

Numerous fuel tanks and sites that host fuel tanks have been identified within the study area (refer to FIPs (Appendix A1/A2), the ERIS Report (Appendix B/B1) and TSSA records search (Appendix E). Those records that have been identified as PCAs are listed here and assessed to determine whether they are to be considered Areas of Potential Environmental Concern to the subject Sites.

- 1171 Stavebank Rd. (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
  - One (1) record that describes a historical fuel leak and usage of an underground fuel storage tank at this location. Due to the nature of the record and the nature of the contaminants involved, there is not considered to be elevated potential for environmental impacts due to this activity.
  - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site
- 20 Rosewood Ave. (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
  - Two records that describe a historical fuel spill of petroleum product from an underground fuel storage tank at this location. Due to the age of these records (2010) and therefore duration of potential risk exposure, and known spill record of 500 L of mixed diesel and water, there is considered to be elevated potential for environmental impacts to this activity
  - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3.
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 150 Lakeshore Rd. E. (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
  - Numerous records describe historical usage of underground fuel storage tanks at this location. Due to the age of the records and therefore duration of potential risk exposure, combined with the volume stored on-site, there is considered to be some elevated potential for environmental impacts associated with this activity.
  - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site.
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 156/158 Lakeshore Rd. E (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
  - Numerous records describe historical usage of underground fuel storage tanks at this location. Due to the age of the records and therefore duration of potential risk exposure, combined with the volume stored on-site, there is considered to be elevated potential for environmental impacts associated with this activity.
  - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site
  - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 160 Lakeshore Road East (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
  - Due to the age of the records and therefore duration of potential risk exposure, combined with the volume stored on-site, there is considered to be elevated potential for environmental impacts associated with this activity.

DRAFT

    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3, however the potential impacts may be limited due to the distance between the two locations (approximately 80 m west of Site LAK_3).
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 170 Lakeshore Road East (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
    - Due to the age of the records and therefore duration of potential risk exposure, combined with the volume stored on site, there is considered to be elevated potential for environmental impacts associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3
    - Linear Works: This PCA is also identified for consideration with respect to the potential linear works.
- 80 High St. E. (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
    - Due to the volume stored on site, there is considered to be elevated potential for environmental impacts associated with this activity.
    - Shaft Sites: This PCA is not considered to be an APEC with respect to a shaft Site
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- St. Lawrence Starch Co. Ltd. - Historically located at 141 Lakeshore Rd. E. (PCA #28: Gasoline and Associated Products Storage in Fixed Tanks)
    - Multiple records that describe historical usage of above ground fuel storage tanks at this location. Due to the age of the records and therefore duration of potential risk exposure, combined with volume stored on-site, there is considered to be elevated potential for environmental impacts associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Sites LAK_3, ELM_5, and ELM_6.
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 76 Cumberland Dr. – Hiawatha SPS (PCA #28 Gasoline and Associated Product Storage in Fixed Tanks)
    - One record that describes historical usage of an above ground diesel fuel storage tank at this location. (i.e., backup diesel generator fuel tank). Due to the age of the records and therefore duration of potential risk exposure, combined with the volume stored on-site, there is considered to be elevated potential for environmental impacts.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site HIA_8
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 60 Elmwood Avenue South – Elmwood SPS (PCA #28 Gasoline and Associated Product Storage in Fixed Tanks)
    - Based on the historical fuel storage and handling at the subject Site related to the back up diesel generator, there is considered to be elevated risk associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Sites ELM_5 and ELM_6.
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 182 Rosemere Road – Rosewood SPS (PCA #28 Gasoline and Associated Product Storage in Fixed Tanks)
    - Based on the historical fuel storage and handling at the subject Site related to the back up diesel generator, there is considered to be elevated risk associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site ROS_1.
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.

DRAFT

6.1.5 Automotive/Transport Systems Maintenance or Service Shops

Shops or yards that provide services to support transport systems or to repair motor vehicles often utilize a range of liquid products that may contain environmental contaminants. Examples of these include motor oil and other lubricants, fuels, waste oils, degreasers and solvents. As a result, these types of operations have the potential to result in environmental impacts.

One (1) current service shop has been identified through the records review (Appendix I (Photographs), adjacent properties site visit notes (Appendix J)) as well as there are historical service shop properties in the study area (FIPs (Appendix A1/A2)). Those that have been identified as Potentially Contaminating Activities (PCAs) are listed here and assessed to determine whether they are to be considered Areas of Potential Environmental Concern.

- 160 Lakeshore Rd. E. (PCA #52 Storage, Maintenance, Fueling and Repair of Equipment, Vehicles, And Material Used to Maintain Transportation Systems)
    - During the site visit, this property was identified as being host to an automotive repair shop. There is elevated potential for environmental impacts associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3, however the potential impacts may be limited due to the distance between the two locations (approximately 80 m west of Site LAK_3).
    - Linear Works: This PCA is identified for consideration with respect to the potential linear works.
- 170 Lakeshore Road East (PCA #52 Storage, Maintenance, Fueling and Repair of Equipment, Vehicles, And Material Used to Maintain Transportation Systems)
    - This property is identified as “Elmwood Motors Ltd.” on the 1952 FIP and it is reported to have hosted a garage, a showroom, a “greasing” building, and a gasoline service operation with 3 USTs. Due to the age of the records and therefore duration of potential risk exposure, there is considered to be elevated potential for environmental impacts associated with this activity.
    - Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3
    - Linear Works: This PCA is also identified for consideration with respect to the potential linear works.

6.1.6 Imported Fill of Unknown Quality

Historically, fill materials were not commonly scrutinized for environmental quality before being imported for use at a construction site. As a result, fill often contained deleterious materials or had other environmental impacts.

Based on the aerial photo review and the fact that most of the Sites were developed prior to circa 1954, it is expected that all Sites have the potential to have been affected by imported fill materials, specifically Sites ELM_5 (located on former industrial property with a nearby railway sidings at the property) and ELM_6 (located on an historically extended shoreline of Lake Ontario).

Therefore, each of the Sites is considered to have “Imported Fill of Unknown Quality” as a Potentially Contaminating Activity (PCA #30) which is considered to form an APECs on each of the subject Sites. Consequently, soils on these Sites may therefore require some degree of sampling and characterization effort to support soil off-site re-use and disposal in accordance with Excess Soil Management regulation (i.e., O.Reg. 406/19).

6.1.7 Drycleaners

Historically, dry-cleaning facilities utilized halogenated solvents (e.g., perchloroethylene) in the dry-cleaning process. These solvents tend to be persistent in the environment, are poorly soluble in water and are denser than water (i.e., Dense Non-Aqueous Phase Liquids, which tend to sink in the subsurface). They also tend to be toxic to humans at relatively low concentrations. As a result, dry-cleaning facilities which used halogenated solvents are commonly sources of environmental impacts.

No dry-cleaning facilities were specifically identified in the ERIS report in the study area. A coin-laundry facility (Washpro Coin Laundromats) located in a strip mall at 195 Lakeshore Rd. E. approximately 180 m northwest of Site ELM_4 and 280 m northwest of Site ELM_6 was identified during the site visit. The laundromat appeared

to feature approximately 15 - 20 washing/drying machines and did not appear to be an active dry-cleaning establishment at the time of the site visit.

As this address was not identified in the ERIS report as a registered waste generator of halogenated solvents, this may suggest that this location may not include a dry-cleaning operation on Site. This property is therefore not considered to be an APEC at this time. Should additional information be obtained that suggests that this location was in fact a dry-cleaning operation (i.e., from additional records from City of Mississauga which are outstanding at the time of issue of this report), this report will be revised to incorporate additional findings.

6.1.8 Former Use Related to Commercial Auto Sales

As discussed in Section 3.3, the LAK_3 Site (located at 3 Elmwood Ave. N.) was historically a used car lot. Based on historical use of this Site related to commercial automotive activities, the historical land use of this Site is being considered a PCA which contributes to an APEC at the subject Site.

Shaft Sites: This PCA is considered to be an APEC with respect to shaft Site LAK_3

Linear Works: This PCA is also identified for consideration with respect to the potential linear works.

6.2 Summary of Areas of Potential Environmental Concern and Conceptual Model

Having evaluated the various PCAs and identified from them those activities which are to be considered Areas of Potential Environmental Concern to subject Sites, the following APECs have been identified, as summarized in Table 66.

For each APEC, the following information has been noted:

- The address of the APEC property, as well as the operation name (if available),
- The reported activities that were identified and resulted in that location being identified as an APEC
    - This activity will correspond to an entry in Table 2 “Potentially Contaminating Activities” of Ontario Regulation 153/04 (where applicable),
- The shaft Sites which that APEC may affect, and,
- The environmental media which may be affected at that Site.

DRAFT

Table 6: Areas of Potential Environmental Concern. (Shaft Sites)

#	Address/ Operation	Activity	Affected Site(s)	Affected Media	PCOCs
1	20 Rosewood Ave. (Harold E Kennedy Park)	Fuel Spills Fuel Tank	LAK_3 (due to downgradient / crossgradient location	Groundwater	BTEX, PHCs F1-F4
2	160 Lakeshore Rd. E. (Midas)	Automotive Repair Garage and historic gasoline service station	LAK_3 (due to short separation distance and cross- gradient location)	Groundwater	BTEX PHCs F1-F4, VOCs
3	170 Lakeshore Road E.	Historical Gasoline Service Station and Automotive Repair Garage	LAK_3 (due to short separation distance and cross-gradient location)	Groundwater	BTEX PHCs F1-F4, VOCs
4	141 Lakeshore Rd. E. Part of a storage yard for large industrial facility (St. Lawrence Starch Co. Ltd.)	Historic industrial facility, underground fuel tanks, multiple railway spurs, ERIS records of multiple ASTs.	LAK_3, (due to short separation distance and cross-gradient location); ELM_5 and ELM_6 (short separation distance and upgradient location)	Soil / Groundwater	Soil (Metals PAHs) Groundwater (BTEX, PHCs, VOCs)
5	3 Elmwood Ave. N.	Historic “Used Car Lot” (1952 FIP)	LAK_3 (on-Site)	Soil / Groundwater	Soil (Metals PAHs) Groundwater BTEX, PHCs, VOCs
6	76 Cumberland Dr. (Hiawatha SPS)	Fuel Tank	HIA_8 (on-Site)	Soil / Groundwater	BTEX, PHCs F1-F4
7	60 Elmwood Ave. S. (Elmwood SPS)	Fuel Tank	ELM-5 and ELM-6 (due to short separation distance and cross-gradient location)	Soil / Groundwater	BTEX, PHCs F1-F4
8	182 Rosemere Rd. (Rosemere SPS)	Fuel Tank	ROS_1 (on-Site)	Soil / Groundwater	BTEX, PHCs F1-F4
9	NA	Imported Fill (on-Site)	All sites	Soil	Metals PAHs

*PAHs = polycyclic aromatic hydrocarbons, PHCs = petroleum hydrocarbons, BTEX = benzene, toluene, ethylbenzene and total xylenes, and VOCs = volatile organic compounds.

DRAFT

Figures 5a through 5e illustrate the identified PCAs on the subject Sites (where applicable) and vicinity. It is noted that monitoring wells were observed on Site LAK_3 and a request was placed to obtain records/reports on this Site as well as other Sites currently owned by the City of Mississauga. Once these records are received, this report and recommendations for further assessment at the subject Sites will be updated accordingly, based on the available information.

Monitoring wells were reported to have been installed, as well as soil and groundwater samples were collected from Site ROS_1 as part of previous geotechnical and hydrogeological investigations by others (Section 3.9). Based on reported results, there were no detections of PHCs or VOCs in the select soil samples collected from the boreholes, and no VOC (including BTEX) detections in the groundwater from the monitoring wells. It is noted that no water quality results were available for PHCs. Should the monitoring wells still be present at Site ROS_1, it is recommended to collect additional water quality samples from the wells to further assess groundwater quality with respect to the potential for PHC impacts. This Site is also located in close proximity to Credit River, and thus the groundwater flow may have a southwesterly component in this portion of the Study Area, which may mitigate the potential for impacts from the reported location of the fuel oil UST at the upgradient property located at 1171 Stavebank Rd.

6.3 Linear Works

Though it is understood that there will be linear works connecting the proposed shaft sites, because the alignment for the linear works has not been confirmed at this stage, no APECs have been assigned to those locations.

However, it is noted that some PCAs have been identified at properties in the greater study area and that these PCAs may be associated with elevated risk of environmental impacts at locations nearby. These PCAs at the following properties should be considered in the planning process for selection of the preferred alignment:

- 15 Hurontario St. – Record of Site Condition for change from commercial to residential use
- 20 Rosewood Ave. – fuel spills and fuel tank
- 114 Lakeshore Rd. East – historical gasoline service station
- 136-138 Lakeshore Rd. E. – historical gasoline service station
- 142-152 Lakeshore Rd. E. – historical railway siding
- 150 Lakeshore Rd. E. – fuel tanks, fuel spills, gasoline service station
- 156/158 Lakeshore Rd E. – fuel tanks
- 160 Lakeshore Rd. E. – fuel tanks
- 170 Lakeshore Rd. E. – historical use as a gasoline service station and automotive garage
- 80 High St. – fuel tanks
- 68 Hurontario St. – historical underground fuel tank
- 141 Lakeshore Rd. E. – historical records regarding industrial use, fuel tanks, rail lines/spurs
- General area – imported fill

Figures 5a through 5e illustrate the identified PCAs on the subject sites and vicinity (where applicable) and should be reviewed during route selection.

It is further noted that the list above is not exhaustive as the scope of this ESA was limited to a certain study area based on the location of the shaft sites. There may be other PCAs present on lands that were not subject to records review or data searches outside of the proposed shaft Sites.

DRAFT

7. CONCLUSIONS

This Phase One Environmental Site Assessment (ESA) was completed to identify potential and/or actual environmental concerns associated with eight (8) Sites of proposed shaft locations resulting from land use activities, whether current or historical and whether those occurred on Sites or on nearby lands. It is our understanding that this Phase One ESA is conducted to support construction shaft site selection which may involve property transfer and/or easement creation and that it is not required to support a Record of Site Condition (RSC) under Ontario Regulation (O. Reg.) 153/04 (as amended).

The information collected as part of this investigation indicates that the potential for environmental impacts at several of the proposed shaft Sites are considered to exist. Nine APECs at the proposed Sites have been identified as summarized in Table 6. To confirm the quality of soil and groundwater at the proposed shaft locations, additional investigation involving sampling and laboratory analysis of soil and groundwater for identified PCOCs is recommended.

8. RECOMMENDATIONS

Based on the findings of this Phase One Environmental Site Assessment concerning the construction shaft Sites proposed as part of the Port Credit East integrated water and wastewater optimization strategy, GMBP make the following recommendations:

1. Shaft sites LAK_3, ROS_1, HIA_8, ELM_5 and ELM_6 are recommended to be subject to additional investigation in the form of a Phase Two Environmental Site Assessment to determine, with greater certainty:
    - Whether impacts are present to soil and/or groundwater,
    - How the impacts may affect construction dewatering and discharge water management, and/or
    - Provide soil quality assessment for the purposes of developing an Excess Soil Management Plan.
2. For the purposes of Excess Soil Management under O.Reg. 406/19:
    a. All sites are recommended to be investigated for soil quality (whether in a standalone investigation or as part of the Phase Two Environmental Site Assessment)
    b. The following Shaft sites are considered to be “enhanced investigation project areas”: ROS_1 (industrial use – sewage pumping station), ELM_5 (industrial use – St. Lawrence Starch Co. Ltd.), HIA_8 (industrial use – sewage pumping station), LAK_3 (potential commercial automotive use associated with used car lot)
3. The additional investigations should be scoped to target the environmental media and potential contaminants of concern (PCOCs) identified by this Phase One ESA and to meet requirements of O. Reg. 406/19.
4. It is recommended that permission be obtained from City of Mississauga to collect groundwater samples from Site LAK_3, provided the existing monitoring wells are accessible and are in good condition to complete the required sampling.

All of which is respectfully submitted,

GM BLUEPLAN ENGINEERING LIMITED

9. STATEMENT OF LIMITATIONS

The information presented in this Phase One ESA report is intended for the sole use of the Region of Peel. GM BluePlan Engineering Limited accepts no liability for use of this information by third parties. Any decisions made by third parties on the basis of information provided in this report are made at the sole risk of the third parties.

The scope of this Phase One ESA was limited to a review of the history of the Sites; a review of available regional mapping and available background reports and information (including prior Phase One ESA and other reports provided by the Region of Peel); surface/topographic features; contact with relevant regulatory agencies; review of available historical records and reports and a site reconnaissance completed on September 12, 2022. This Phase One ESA assumes that a Record of Site Condition (RSC) under O. Reg. 153/04 (as amended) is not required to be filed for this property.

GM BluePlan Engineering Limited cannot guarantee the accuracy or reliability of information provided by others or presented in records and reports available for the property. GM BluePlan Engineering Limited does not accept liability for unknown, unidentified, undisclosed or unforeseen surface or sub-surface contamination that may be later identified.

The scope of this Phase One ESA was limited to investigating the actual or potential sources of environmental impact or environmental risk and does not include full confirmation of actual environmental impact or environmental risk. While comments have been made regarding the inferred groundwater flow direction and the perceived risks of potential environmental concerns to soil and groundwater at the Site from onsite or offsite sources, full confirmatory assessment of soil and groundwater conditions is beyond the scope of this assessment. Further, while comments have been made regarding the perceived risks of potential environmental concerns, a complete risk assessment is beyond the scope of this report.

This report is believed to provide documentation of site conditions as of September 12, 2022.

APPENDIX A1:
FIRE INSURANCE PLANS SUMMARY

DRAFT

Date:	10/27/2022	File:	719033
To:	GMBP Team		
From:	Joanna Olesiuk		
Project:	Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule C Class Environmental Assessment		
Subject:	Fire Insurance Plans review notes for Phase One ESA		

TECHNICAL MEMO

For the purposes of this memo, the direction "north" means the direction along Hurontario Street toward Highway 403.

Notes:

- *UST - underground storage tank*
- *Addresses (where noted) are based on the addresses appearing on the FIPs, which may differ from currently assigned civic addresses*

Rosemere Rd. (and area); Sites ROS_1 and ROS_2

FIP Year and Sheet	Location	Results
Site		
1952 (Sheet 1921)	ROS_1- East of Stavebank Rd., north of CNR right-of-way	Site appears vacant. Rosemere Rd. does not appear to be present in 1952.
1952 (Sheet 1921)	ROS_2 – south of Sandham Road, north of CNR right-of-way	Sandham Road right-of-way.
Study Area		
1952 (Sheet 1921)	Sandham Road, Mona Road and Vesta Drive area, CNR right-of- way south of Site	Residential properties and CNR right-of-way (1952)

DRAFT

Site LAK_3 - Lakeshore Rd E (and surrounding area)

FIP Year and Sheet	Location	Results
Site		
1928 (Sheet 4)	Elmer Ave. N. and Lakeshore Rd. E	No address listed. Site appears vacant.
1952 (Sheet 1909)	Elmwood Ave. N. and Lakeshore Rd. E	Used car lot (no other details apparent on FIP for this property)
Study Area		
1928 (Sheet 4)	Elmer Ave. N. and Lakeshore Rd. E. area	Adjacent properties to the north and east appear developed with residential, or potentially commercial uses (no details apparent). 464 Toronto Road (inferred 162 Lakeshore Road, approximately 90 m southwest of site) – Garage with 2 USTs 440 Toronto Road (inferred 144 Lakeshore Road) (approximately 170 m southwest of site) – gasoline service station with what appear to be 2 USTs No address (approximately 380 m west of Site) – south of railway line – portion of railway right-of-way labelled as "Imperial Oil Limited" with 2 what appear to be vertical storage tanks, and structure labelled "oil pumping".
1928 (Sheet 4)	Hurontario and First St. (Troy St.)	2 properties with 3 USTs – northerly property labelled "Coad and Wood Yard) – approximately 460 m northwest of the Site
1928 (Sheet 8)	Toronto Road (Lakeshore Rd.)	St. Lawrence Starch Co. Ltd. – multiple buildings, several railroad sidings, coal storage area in the north part of property (fuel for property buildings identified as coal).
1952 (Sheet 1909)	170 and 162 Lakeshore Rd. E.	Gasoline Service Station/Elmwood Motors Limited (25 m to 90 west of Site) with 3 USTs at 170 Lakeshore Rd. E. (25 m west of Site).
July 1952 (Sheet 1908)	141 Lawrence Rd. E.	Location of St. Lawrence Starch Co. Ltd. - property bound by Hurontario/Lakeshore Rd. E/Elmwood Ave. S. consists of multiple buildings, several railroad sidings, 2-5,000 L fuel oil USTs, 500 L gasoline UST (approximately 200 m south of Site LAK_3)
1952 (Sheet 1909-05)	144, 152, 154 and 156 Lakeshore Road East	2 gasoline service stations with additional buildings (7 USTs in total at the 3 properties), 1 building labelled "Greasing" (properties bound by Orchard Ave. to the north, railway siding to the south) (approximately 140-170 m southwest of Site LAK_3)
1952 (Sheet 1907)	136 Lakeshore Rd. E	Bruce MacDougall Motors Used Car Lot with paint shop/garage and 2 USTs (corner of Lakeshore Rd. E. and Hurontario St., approximately 320 m southwest of LAK_3 and 300 m west/northwest of ELM_5)
1952 (Sheet 1907)	114 Lakeshore Rd. E	Gasoline Service Station – 3 USTs (corner of Helene St. N and Lakeshore Rd. E., approximately 450 m southwest of LAK_3)
1952 (Sheet 1922)	58 Hurontario	W.H. Thomson – multiple buildings, 1 UST (approximately 400 m west of LAK_3)

DRAFT

Elmwood Ave. S. (and area) Sites ELM_4, ELM_5 and ELM_6

FIP Year and Sheet	Location	Results
Site ELM_4		
1952 (Sheet 1908)	Elmwood Ave. S./Wanita Rd.	Elmwood Ave. S./Wanita Rd. right-of-way
Study Area		
1952 (Sheet 1908)	Elmwood Ave. S./Wanita Rd.	Residential and vacant land to the north and east, St. Lawrence. Starch Co. Ltd. Industrial property to the west and south
Site ELM_5		
1928 (Sheet 8) 1952 (Sheet 1908)	141 Lakeshore Rd. E.	Appears to be part of a storage yard for large industrial site (St. Lawrence Starch Co. Ltd.)
Study Area		
1928 (Sheet 8) 1952 (Sheet 1908)	South of Lakeshore Rd. E.	Lake Ontario shoreline to the south, inferred residential to the north
Site ELM_6		
1952 (Sheet 1908)	Elmwood Ave. and Lakeview Blvd.	Intersection of Elmwood Ave. and Lakeview Blvd. right-of-way, vacant land/Lake Ontario shoreline to south
Study Area		
1952 (Sheet 1908)	Elmwood Ave. and Lakeview Blvd.	Residential and vacant lands, Lake Ontario Shoreline

Hiawatha Pkwy. (and area): Sites HIA_7 and HIA_8

FIP Year and Sheet	Location	Results
Site HIA_7		
1928 (Sheet 1) 1952 (Sheet 1910)	Hiawatha Pkwy. and Wanita Rd.	Right-of-way in what appears to be a residential area
Study Area		
1928 (Sheet 1) 1952 (Sheet 1910)	Hiawatha Pkwy. and Wanita Rd.	Several properties in the Site vicinity are developed with what appear to be residential uses.
Site HIA_8		
1928 (Sheet 1)	Hiawatha Pkwy. and Cumberland Dr.	Cumberland Dr. and Hiawatha Pkwy. right-of-way, remainder of Site appears undeveloped based on limited detail presented on the FIP
1952 (Sheet 1910)		Structure labelled as “pump house” and vacant land (inferred parkland)
Study Area		
1928 (Sheet 1) 1952 (Sheet 1910)	Hiawatha Pkwy. and Cumberland Dr.	Residential and vacant land (inferred parkland)

Note: Some sheets of the 1910 FIP and 1928 FIP show limited detail and appear to be an index map with no additional detail sheets provided by Opta.

Opta Historical Environmental Services Enviroscan™ Terms and Conditions

Report

The documents (hereinafter referred to as the "Documents") to be released as part of the report (hereinafter referred to as the "Report") to be delivered to the purchaser as set out above are documents in Opta's records relating to the described property (hereinafter referred to as the "Property"). Opta makes no representations or warranties respecting the Documents whatsoever, including, without limitation, with respect to the completeness, accuracy or usefulness of the Documents, and does not represent or warrant that these are the only plans and reports prepared in association with the Property or in Opta's possession at the time of Report delivery to the purchaser. The Documents are current as of the date(s) indicated on them. Interpretation of the Documents, if any, is by inference based upon the information which is apparent and obvious on the face of the Documents only. Opta does not represent, warrant or guarantee that interpretations other than those referred to do not exist from other sources. The Report will be prepared for use by the purchaser of the services as shown above hereof only.

Disclaimer

Opta disclaims responsibility for any losses or damages of any kind whatsoever, whether consequential or other, however caused, incurred or suffered, arising directly or indirectly as a result of the services (which services include, but are not limited to, the preparation of the Report provided hereunder), including but not limited to, any losses or damages arising directly or indirectly from any breach of contract, fundamental or otherwise, from reliance on Opta Reports or from any tortious acts or omissions of Opta's agents, employees or representatives.

Entire Agreement

The parties hereto acknowledge and agree to be bound by the terms and conditions hereof. The request form constitutes the entire agreement between the parties pertaining to the subject matter hereof and supersedes all prior and contemporaneous agreements, negotiations and discussions, whether oral or written, and there are no representations or warranties, or other agreements between the parties in connection with the subject matter hereof except as specifically set forth herein. No supplement, modification, waiver, or termination of the request shall be binding, unless confirmed in writing by the parties hereto.

Governing Document

In the event of any conflicts or inconsistencies between the provisions hereof and the Reports, the rights and obligations of the parties shall be deemed to be governed by the request form, which shall be the paramount document.

Law

This agreement shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

Report

The documents (hereinafter referred to as the "Documents") to be released as part of the report (hereinafter referred to as the "Report") to be delivered to the purchaser as set out above are documents in Opta's records relating to the described property (hereinafter referred to as the "Property"). Opta makes no representations or warranties respecting the Documents whatsoever, including, without limitation, with respect to the completeness, accuracy or usefulness of the Documents, and does not represent or warrant that these are the only plans and reports prepared in association with the Property or in Opta's possession at the time of Report delivery to the purchaser. The Documents are current as of the date(s) indicated on them. Interpretation of the Documents, if any, is by inference based upon the information which is apparent and obvious on the face of the Documents only. Opta does not represent, warrant or guarantee that interpretations other than those referred to do not exist from other sources. The Report will be prepared for use by the purchaser of the services as shown above hereof only.

Disclaimer

Opta disclaims responsibility for any losses or damages of any kind whatsoever, whether consequential or other, however caused, incurred or suffered, arising directly or indirectly as a result of the services (which services include, but are not limited to, the preparation of the Report provided hereunder), including but not limited to, any losses or damages arising directly or indirectly from any breach of contract, fundamental or otherwise, from reliance on Opta Reports or from any tortious acts or omissions of Opta's agents, employees or representatives.

Entire Agreement

The parties hereto acknowledge and agree to be bound by the terms and conditions hereof. The request form constitutes the entire agreement between the parties pertaining to the subject matter hereof and supersedes all prior and contemporaneous agreements, negotiations and discussions, whether oral or written, and there are no representations or warranties, or other agreements between the parties in connection with the subject matter hereof except as specifically set forth herein. No supplement, modification, waiver, or termination of the request shall be binding, unless confirmed in writing by the parties hereto.

Governing Document

In the event of any conflicts or inconsistencies between the provisions hereof and the Reports, the rights and obligations of the parties shall be deemed to be governed by the request form, which shall be the paramount document.

Law

This agreement shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

DRAFT

APPENDIX B1:
ERIS REPORT SUMMARY

Date:	9/6/2022	File:	719033
To:	GMBP Team		
From:	Mark Ongarato		
Project:	Port Credit East Water and Wastewater Servicing Optimization Strategy Schedule C Class Environmental Assessment		
Subject:	ERIS report review for Phase One ESA		

TECHNICAL MEMO

For the purposes of this memo, the direction "north" means the direction along Hurontario Street toward Highway 403.

Notes:
Items in Blue text represent records returned by the ERIS Report that are considered to indicate the most significant records within the project Study Area and outside of the immediate 100 m study area of each Site.
Items in Red text represent records returned by the ERIS Report that are considered to indicate the most significant records within the project Study Area and are within the immediate 100 m study area of a particular Site.
UST – underground storage tank
(2) – number of records in a specific database (where number of records is greater than 1)

Rosemere Rd (and area)
(ROS_1 & ROS_2)

ERIS Database	No. of Records	Results
Site		
Certificate of Approval	4	3 records of Municipal Sewage Approval in 1994 - 182 Rosemere Rd. – R.M. of Peel - Sew. P.S. 1 record of industrial air, Standby Gen-Set for sewage pump station – Nitrogen Oxides, Sulphur Dioxide – 182 – Rosemere Rd – R.M. of Peel – Sew. P.S.
Environmental Activity and Sector Registry	2	2 records for Water taking – Construction Dewatering – 182 Rosemere Rd, The Regional Municipality of Peel – February 11, 2020 & June 9, 2020
Environmental Compliance Approval	1	1 record for equipment and emission sources at the Rosemere Road Sewage Pumping Station - 182 Rosemere Rd – April 14, 2020
Study Area		
Borehole	83	Numerous records of boreholes at properties in the Study Area.
Environmental Activity and Sector Registry	1	1 record for construction dewatering – 30 Queen St. E – Salini Impregilo Civil Works Inc. – April 30, 2021
Environmental Compliance Approval	1	1. 1 record for Municipal and Private Sewage Works – 1130 Mona Rd 1136 & 1138 Mona Rd – April 13, 2022

Notice: IMPORTANT LIMITATIONS and YOUR LIABILITY

Reliance on information in Report: This report DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as a database review of environmental records.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Limited Partnership ("ERIS") using various sources of information, including information provided by Federal and Provincial government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report (s) are protected by copyright owned by ERIS Information Limited Partnership. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

Executive Summary

Property Information:

Project Property:	*Port Credit W/WW* *Port Credit W/WW Mississauga ON L5G 3M8*
Project No:	

Order Information:

Order No:	*22072501112*
Date Requested:	*July 25, 2022*
Requested by:	*GM BluePlan Engineering Limited*
Report Type:	*Quote - Custom-Build Your Own Report*

Historical/Products:

City Directory Search	*CD - Subject Site plus 5 Adjacent Properties*
ERIS Xplorer	*ERIS Xplorer*
Insurance Products	*Fire Insurance Maps/Inspection Reports/Site Plans*
